Technical information should always be available to the foremen and mechanics, because their careful and constant adherence to the instructions is essential to ensure vehicle road-worthiness and safety. In addition, the normal basic safety precautions for working on motor vehicles must, as a matter of course, be observed.

44 – Wheels, tyres, vehicle geometry

1 General notes on wheels and tyres (passenger cars)

(VRL006749; Edition 05.2014)

This information is intended to help you form an opinion as precise and accurate as possible in cases of tyre damage and other complaints.

In this chapter you will learn more about tyres and wheels/rims.

Tyres are high-tech products that are especially adapted to the requirements of modern vehicles.

As with all highly developed technical products, tyres require proper care, maintenance and service. This is essential to ensure safety, performance and comfort for the entire service life of the tyre.

Tyres are constantly being further developed. Quality tyres are the result of modern design methods and production processes, as well as continuous quality checks. All tyres that are recommended by VW have been tested by the technical development department and have been designed specifically for each model in collaboration with the tyre manufacturers.

We therefore recommend fitting only the recommended tyre makes when renewing tyres.

Vehicle safety is the top priority. With regard to the various operating conditions such as

- differing speed ranges,
- winter and summer use and
- wet and dry roads,

the optimal compromise for vehicle safety must be found.

Every tyre is subjected to a wide range of different driving conditions over its entire service life. It is therefore important that the basic requirements for ensuring optimal tyre performance are met.

Proper adjustment of the axle geometry during wheel alignment is an important prerequisite for ensuring the maximum service life of the tyre. The wheel alignment must always be within the specified tolerance range.

Information for wheel alignment ⇒ Running gear, axles, steering; Rep. gr. 44 .

Note

Tyre damage and related problems can have various causes. It is therefore very important that one determines whether the problem has been caused by the tyre or by other components.

Normal wear and tear on a tyre will alter its characteristics. Rolling noises or rough running can be the result of such wear. These are simply the symptoms of normal wear and tear and do not constitute damage in the sense of the tyre being defective. You can take measures to eliminate the symptoms at least to some degree. However, in some cases it may not be possible to eliminate tyre noise completely.

Special models are only partly represented in the tables in Appendix 2 for parts certificate. Modification of these vehicles depends on the engine capacity of the basic model.

2 Legislative and technical conditions for converting wheel and tyre combinations

2.1 Legislative conditions for converting wheel and tyre combinations

The manufacturer is issued with a general operating permit (GTA in accordance with § 20 StVZO (German road traffic and licensing regulations) and EU operating permit) for the overall vehicle with all parts for specific conversions.

Conversions of wheels and tyres can only be carried out under certain conditions. When doing this, the following points must be observed:

- If the size of wheel and tyre, with an indication of the load index and the speed symbol, is included in the vehicle GTA and EU operating permit/type approval ⇒ page 7 , this wheel and tyre combination can be fitted on the vehicle without any problem.

It is not necessary for the wheel and tyre combination specified in the registration certificate part I (certificate of registration) to be fitted. All combinations approved in the vehicle GTA or EU operating permit/type approval ⇒ page 7 may be fitted to the vehicle.

- For the conversions recommended by VOLKSWAGEN AG (see appendix to parts certificate) there are no general operating permits in accordance with § 22 StVZO (German road traffic and licensing regulations).
- Unless the wheels and/or tyres are included in the relevant vehicle GTA or EU operating permit/type approval, the vehicle will no longer meet the requirements of the road traffic regulations if converted.

These versions are based on the conditions valid in the European Union and no guarantee can be provided for their completeness. In some cases there are different legislative requirements outside the European Union.

The table included in the appendix for parts certificate shows the VOLKSWAGEN AG recommended and TÜV NORD Mobilität GmbH & Co. KG tested wheel and tyre combinations on VW vehicles and also the conditions to be observed for fitting. The use of genuine disc-type wheels on a vehicle to which they have not been allocated is not permissible.

The list of possible conversions deals with combinations that meet the requirements of VOLKSWAGEN AG with regards to road handling and road safety. They are the result of practical trials and are therefore recommended by VOLKSWAGEN AG.

Refer also to the new vehicle registration documents that were issued from 01.10.2005 ⇒ page 6 .

2.2 Technical conditions for converting wheel and tyre combinations

- The wheel and tyre combinations and conversions listed in the tables of the individual vehicles refer exclusively to Volkswagen genuine disc-type wheels.

satelettronica

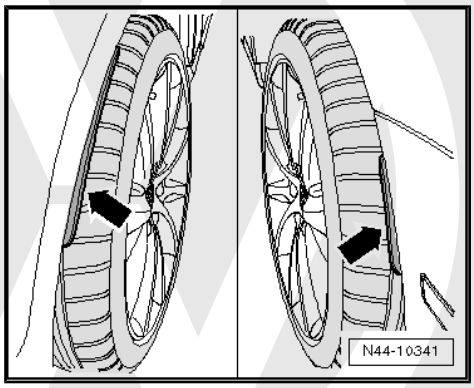
- Approval of wheel and tyre combinations or a change to wheels from the accessories trade is not possible with the parts certificate attached here.
- Tubeless radial tyres may only be fitted to rims with a safety hump feature on the shoulder.
- Tyres with run-flat properties (reinforced side walls) may only be used on disc-type wheels with an extended hump and on vehicles with a tyre pressure monitoring system ⇒ page 56 .
- If the wheel and tyre combinations listed are used, the associated tyre inflation pressures must be adhered to. The tyre inflation pressures for summer tyres can be found on the sticker on the inside of the tank flap or in the tables of the individual vehicles.
- Sufficient clearance to the wheels and tyres at parts of the wheel housing, suspension and braking system is assured if the notes and specifications established in the parts certificate are observed in all operating conditions.
- Unless otherwise stated, snow chains may only be fitted to the drive wheels. On all-wheel drive vehicles, however, only the front wheels may be fitted with snow chains.

2.3 Additional wheel housing extensions (flaps)

For technical reasons some vehicles require wheel housing extensions (flaps) on the wing or bumper -arrows- when using certain wheel and tyre combinations.

Please check if there is a requirement to remove the flaps.

The information is located in the overview table for the respective vehicle.



2.4 “Series 80” tyres

Tyres of the “80” series (e.g. 145/80 R 13 74 S) will replace the “82” series (e.g. 145/82 R 13 74 S). Lawmakers have stipulated that “82” series tyres may be replaced by “80” series tyres without having been entered in the vehicle documents.

The condition for this is that the “80” series tyres have the same width, be of the same type – cross-ply or radial belted – and have the same or higher load index.

If only “80” series tyres are entered in the vehicle documents, “82” series tyres may only be used if an entry has been made in the vehicle documents.

2.5 Vehicles with Plus running gear

The Plus running gear differs from the basic running gear in the following components:

- Suspension link
- Swivel joint
- Wheel bearing housing
- Anti-roll bar with coupling rod (not on Passat)

satelettronica

- Drive shaft
- Wheel hub
- Brake disc
- Brake caliper
- Wheel rim

One of the identifying features of the Plus running gear is the connection between the swivel joint and the wheel bearing housing.

A - Connection between swivel joint and wheel bearing housing on basic running gear

B - Connection between swivel joint and wheel bearing housing on Plus running gear

The 5 wheel bolts on each wheel are the most visible identifying feature. The Passat VR6 to 09.93 is an exception. From 06.91, this vehicle was produced with 5 wheel bolts, but was gradually equipped with the Plus running gear from 02.92.

3 Documents and codes/designations

3.1 New vehicle registration documents since 01.10.2005

The implementation of EU Directive 1999/37/EU "Registration Documents for Vehicles" in national law and legal requirements for data protection have necessitated the introduction of new, falsification-proof registration documents.

Since 01.10.2005, only the new documents are issued by the registration authorities in the event of new registrations, change of ownership, registration of technical modifications and all other matters.

The new registration documents are comprised of:

- Registration certificate part I, which replaces the certificate of registration and
- Registration certificate part II, which replaces the vehicle log book.

Registration certificate part I (certificate of registration)

- Contains all vehicle technical data which must be available to register a vehicle in Europe; however, only one wheel and tyre combination approved as standard is specified
- Contains the EU-wide, standardised, alphanumerical codes assigned to the technical data, so that the German registration certificate can be converted without problems into the registration document prescribed in non-member European countries for registration there
- Contains a field for documenting temporary or final immobilisation of the vehicle, and is therefore no longer withdrawn in the event of temporary or final immobilisation

Registration certificate part II (vehicle log book)

- Contains the note that the holder of the registration certificate is not identified as the owner
- Contains only the current and, if applicable, the last vehicle owner; the actual number of previous owners is shown numerically
- Contains only a small percentage of the technical vehicle data
- No longer serves to document temporary vehicle deregistration. The vehicle and body type specified under number 1 in the old vehicle documents will not exist in the future. In the new documents, this will be replaced by standardised EU vehicle classes with body type

Introduction of the new registration documents will lead to barely any changes for the vehicle operator.

Like the old certificate of registration, the registration certificate part I (certificate of registration) must be kept in the vehicle and submitted to responsible persons on request.

It is not necessary for the wheel and tyre combination specified in the registration certificate part I (certificate of registration) to be fitted. All combinations approved according to the general vehicle type approval or EU type approval ⇒ page 7 may be fitted.

The validity of a wheel and tyre combination which deviates from the general vehicle type approval or EU type approval must still be verified via an entry in the registration certificate part I (certificate of registration), an installation certificate based on a part

certificate or general type approval for the wheel and tyre combination.

3.2 COC document (EEC Certificate of Conformity)

Manufactures of motorized vehicles must apply for an EU operating permit for all class M1 passenger carrying vehicles.

A certificate is produced on the basis of this operating permit - the COC (Certificate of Conformity).

This document certifies that the vehicle complies with the EU operating permit (EU type approval) and can be registered in every EU country without an individual type approval.

The document will be issued for all vehicles that comply with the EU operating permit.

These vehicles have an EU type plate (black sticker) in the area of the driver's door, or in the case of older vehicles, in the engine compartment.

The COC document has the same value as the registration document and therefore the original should not be carried on the vehicle.

The COC document contains the EU general type approval number and detailed technical information on the vehicle such as emissions classification and all the permitted wheel and tyre combinations.

3.3 Official type designations

Passenger cars licensed for road use in Germany need a general type approval for the issue of a vehicle title document.

The type approval is issued by the Federal Ministry for Transport in Flensburg following type inspection. This procedure was permitted until 31.12.1997 and, in exceptional cases, even after that.

Other member states of the European Union (EU) have different procedures for issuing a document similar to the German title document. Until 31.12.1997, each member state was entitled to issue its own national type approvals according to its own procedures.

Since 1.1.1998, all passenger cars licensed within the European Union must have a type approval corresponding to EU guidelines. Vehicles licensed for road use with single-vehicle approval according to § 21 StVZO in Germany are excepted.

This means the same guidelines apply to all vehicle manufacturers. This makes it easier to trade across national borders within the EU.

Official type approval, sales or trade designation

In the following table, all VW vehicles which already have EU type approval are listed in the column "EU type".

All VW vehicles which were granted type approval according to the procedure valid up to 31.12.97 are listed in the column "General type approval (GTA)"

If entries appear in both columns "General type approval (GTA)" and "EU type", there exist vehicles of this model which are approved according to both the StVZO and the EU guidelines. In this case, one must first establish what sort of vehicle one has. There are two possibilities:

1. possibility

The last page of the vehicle title includes the field “Certified holder of a general type approval/EEC type approval”. Either the general

type approval number of the EU type approval number is entered here, assuming it is the original vehicle title document. This is the case only if the vehicle was not deregistered in the past for longer than 12 months.

2. possibility

Check whether the general type approval number or the EU type approval number is entered on the vehicle identification plate.

3.4 EU general type approval number, sales type and sales or trade designation

Since 1.1.1998, all passenger cars licensed within the European Union must have a type approval corresponding to EU guidelines. Vehicles licensed for road use with single-vehicle approval according to § 21 StVZO in Germany are excepted.

Load rating code / load index (LI)

The load rating can be found on the sidewall of the tyre. It provides information about the maximum load that the tyre can bear.

The load rating is included in the size designation of the tyre (e.g. 195/65 R 15 91T). It is indicated on the tyre as a code according to ETRTO. The following table shows the load rating codes used at VW with the corresponding load capacity of the tyres.

4.3 Speed ratings for tyres

The speed rating (e.g. “T”) following the size of the tyre (e.g. 185/65 R 14 86T)) indicates the maximum permitted speed (v_{max}) of the tyre.

The tyres for the vehicle must be selected so that their maximum permitted speed is greater than the maximum speed that the vehicle (“based on model”) can attain.

Vehicles with national type approval

If the vehicle has a national type approval, the maximum speed for the vehicle is calculated as follows:

Formula for vehicles with v_{max} up to 150 km/h

v_{max} = 1.03 x v + 3.5 km/h ⇒ page 13

Example: Specified maximum speed v = 145 km/h

v_{max} = 1.03 x 145 km/h + 3.5 km/h = 152.85 km/h

In this example, a tyre with the speed rating “Q” or higher must be used.

Formula for vehicles with v_{max} above 151 km/h

v_{max} = 1.01 x v + 6.5 km/h ⇒ page 13

Example: Specified maximum speed v = 163 km/h

v_{max} = 1.01 x 163 km/h + 6.5 km/h = 171.13 km/h

In this example, a tyre with the speed rating “S” or higher must be used.

Vehicles with EC type approval

If your vehicle has an EC type approval, the maximum speed for all vehicles is calculated as follows:

v_{max} = 1.05 x v ⇒ page 13

Example: Specified maximum speed v = 172 km/h

v_{max} = 1.05 x 172 km/h 180.60 km/h

In this example, a tyre with the speed rating “T” or higher must be used.

It is permitted to use tyres with a higher speed rating. The same applies to tyres with a higher load index.

Note

For the letter “v”, enter the maximum speed given in field “T” of part I or II of the registration document or under number 6 of the vehicle documentation. This calculation is necessary because all vehicles, for technical reasons, achieve different maximum speeds within a legally permitted tolerance.

4.4 Undulations

Radial depressions are slight concavities in the tyre sidewall.

They run from the bead towards the shoulder of the tyre. These parts appear in the figure ⇒ page 42 .

The cause is the accumulation of material at the joints of the tyre components.

Undulations have no effect on:

- Safety,
- Service life,
- Handling or
- Other characteristics of the tyre.

Undulations are visible to varying extents. It is not necessary to inspect the tyre or remove it from the rim.

satelettronica

What causes undulations?

Modern steel belted tyres are constructed with single-ply side walls to save weight.

The sidewall components consist of long strips before they are joined together to form a tyre. They must overlap at the joints. Consequently, slight irregularities or waves are created in the area of the overlapping parts. The overlaps are easier to see from the outside due to the single-ply construction.

4.5 Tyre storage

Storage room

The conditions have to be:

- dark
- dry,
- cool and
- ventilated

in the tyre storage room.

> ⚠ WARNING
>
> *Stored tyres must not come in contact with fuel, oil, grease or chemicals under any circumstances. Otherwise, the material in the tyre will be damaged by chemical reactions which are not always visible.*
>
> *As a result, dangerous situations can occur when the car is driven.*

Of course, tyre damage occurs only if the tyre is in contact with the chemical for a relatively long time. If a few drops of fuel land on a tyre during a fill up, this is of no concern.

Storing the tyres

Complete wheels

Tyres mounted on wheels can be stored flat, stacked one upon the other. In this case, it is important to ensure that the tyres are clean and dry. The inflation pressure should be increased to a maximum of 3 bar.

Tyres without wheels

Tyres without wheels are best stored standing vertically. If tyres are stacked for a long period of time, they will be pressed together quite considerably. The tyres will then be more difficult to fit, as they do not sit on the rim shoulders. If tyres are stored standing vertically, it is recommended to turn them every 14 days to avoid flat spots.

4.6 Tyre ageing

Tyres age as a result of physical and chemical processes, which can impair the function of the tyres. Tyres which are stored for longer periods of time harden and become brittle faster than tyres which are constantly in use on a vehicle. Older tyres may develop hairline cracks as a result of ageing. When tyres are in regular use, the constant flexing activates softeners in the rubber, preventing hardening and the development of cracks.

It is therefore important to take into account not only the tread depth, but also the age of spare tyres, stored tyres and tyres which are not permanently in use. The tyre age can be determined from

satelettronica

in the DOT designation, which includes the production date of the tyre.

Example of a DOT number to 31.12.1999

DOT	5 0	9	< Stands for 199_
		Last digit is production year	
	Week		

In this example, the production date is the 50th week of 1999.

Example of a DOT number from 01.01.2000

DOT	0 1	0 0 Last 2 digits is production year
	Week	

In this example, the production date is the 1st week of 2000.

Recommendation

- It is recommended not to use summer and winter tyres which are older than 6 years anymore. The original properties deteriorate due to the aging process. Winter tyres especially lose their adhesion properties.
- When new tyres are fitted, the spare tyre may also be used if it is in flawless condition and is not more than 6 years old. The age of the tyre has a great influence on the high-speed capability of the tyre. It is possible to combine a spare tyre which is several years old with new tyres; however, this can have an adverse influence on car handling.
- Tyres are constantly being further developed, which can lead, for example, to slight changes in the rubber compound, even if the tyres are of the same make, size and tread pattern.
- All VW vehicles are factory-fitted with four identical tyres and wheels.

Front-wheel drive vehicles:

- For reasons of safety, tyres of the same make and with the same tread pattern should be mounted on one axle.

Four-wheel drive vehicles:

- Vehicles with four-wheel drive must always be equipped with four wheels with tyres of the same size, construction, tread pattern and make.

Renewing tyres

Tyres must always be renewed when:

- the legal minimum tread depth of 1.6 mm is reached,
- there is visible mechanical damage

4.7 Winter tyres

Use of winter tyres

As of 01.05.2006, a change to the German road traffic regulations (StVO) came into force which caused the following supplement to be made: "The equipment in motor vehicles has to be adapted to the weather conditions. In particular, this includes suitable tyres and antifreeze in the windscreen washing system."

satelettronica

Please point out to customers that, since May 1st 2006, they are legally obliged to adapt their vehicle's equipment, particularly the tyres, to winter weather conditions.

For driving in winter, we recommend that the vehicle be equipped with winter tyres in the sizes recommended in table 2 of the parts certificates.

As a basic rule:

All tyre sizes listed in the vehicle documents can also be used as winter tyres.

The handling characteristics may be affected by the use of winter tyres and the possible change in the dimensions of the wheel and tyre. Therefore, when using winter tyres, you must adapt your speed to the changed handling characteristics and to the road conditions.

To achieve the best possible handling, winter tyres must be fitted on all wheels.

If the vehicle is equipped with rims other than the factory-fitted rims, you must take the following into consideration when you fit winter tyres:

- Wheels and wheel bolts are matched.
- Whenever the wheels are changed, corresponding wheel bolts of the correct length and with the correctly shaped tapered seats are used [1]. The secure fit of the wheels and the functioning of the brakes depends this.
- The suitability of winter tyres with less than 4…5 mm tread depth for winter operation is limited.
- Some countries require winter tyres to have a tread depth of at least 4 mm.
- We recommend that winter tyres be replaced after no more than six years. The special “winter properties” of these tyres decline with age, regardless of how much they are used.

Vehicles with tyre pressure control

On vehicles with tyre pressure control, the tyre inflation pressure has to be resaved or matched when changing over between summer and winter tyres ⇒ Workshop manual - Running gear - for relevant model .

1) A spherical cap is the curved surface of a section of a sphere cut by a plane. The tapered seats on the wheel bolt and in the wheel (rim) in the wheel bolt holes are spherical caps.

4.8 Winter tyres with speed symbol “V”

The tyre industry now supplies winter tyres with speed symbol "V". But only under certain conditions may these tyres be used up to the maximum permitted speed v_{max} = 240 km/h.

Vehicles with V tyres

Vehicles requiring V tyres according to the vehicle's title document can use winter tyres with speed symbol V without restriction at speeds up to v_{max} =240 km/h.

Vehicles with W, Y or ZR tyres:

Under certain circumstances, vehicles requiring W, Y or ZR tyres according to the vehicle's title document may not be driven at speeds of v_{max} = 240 km/h.

Why?

V summer tyres and V winter tyres without special identification ⇒ page 17 have 100 % of their maximum load capacity (as

Protected by copyright. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.
satelettronica

specified by their load index “LI”) ⇒ page 17 only up to speeds of 210 km/h.

Travelling at over 210 km/h is possible with V winter tyres only if the maximum load of the tyres is not exceeded. The load capacity of the tyres decreases as the speed increases.

The maximum permitted axle load and the maximum achievable speed of some VW vehicles are so high that the load capacity of the V tyres is not sufficient for speeds of up to 240 km/h.

example: Tyre 205/55 R 16 91V

The load index (LI) 91 certifies that this tyre has a load capacity of 615 kg per tyre at up to 210 km/h.

At a speed of 240 km/h, this tyre can carry a load of only 560 kg, i.e. the axle load may not exceed 1120 kg.

The Passat Variant V6 4Motion has a permitted axle load of 1150 kg and an achievable maximum speed of 232 km/h. This vehicle may only travel at speeds of up to 230 km/h with V winter tyres.

This applies to all V winter tyres without special markings.

4.9 Extra Load (XL) V winter tyres

V winter tyres marked XL have a higher load capacity than V winter tyres without this code.

XL V winter tyres allow a higher speed, but this does not mean that the top speed of a V tyre is 240 km/h for every VW car.

The same conditions apply to these tyres as to V winter tyres without a special code!

Tyre pressure for Extra Load V tyres

The following table ⇒ page 17 shows how fast VW cars may drive with V winter tyres, depending on their respective axle load.

Registration regulations in the Federal Republic of Germany

Only when winter tyres are in use may the top speed that a vehicle can achieve be greater than the maximum speed specified by the speed symbol of the tyre.

In this case, a label stating the following must be attached:

Important! Winter tyres!
Maximum speed … km/h

Note

This label must be clearly visible to the driver!

Winter tyre inflation pressures

Tyre pressure information is located on the tyre pressure plate on the inside of the tank flap or on the driver side B-pillar.

4.11 Reinforced and Extra Load (XL) tyres

Some tyre manufacturers have for some time replaced the designation “Reinforced” with the designation “Extra Load”. This designation has long been standard in non-European countries. Technically, there is no difference between them.

Some tyre manufacturers also use the designation “XL” for Extra Load tyres.

Tyres with the designation “Reinforced” or “Extra Load (XL)” are of equal quality.

4.12 Snow chains

Snow chains must be fitted to driven wheels only.

On all-wheel drive vehicles, however, only the front wheels may be fitted with snow chains.

It is not possible to use snow chains with all wheel and tyre combinations. Notes on this can be found in the vehicle tables of the parts certificate.

If no particular type of snow chain is specified, then small-link chains may be used. These, including the chain fastener, may not

satelettronica

protrude more than 15 mm beyond the wheel's tread and the inner wall.

On some models, only special, small-link chains are possible with certain wheel and tyre combinations. Notes on this can be found in the vehicle tables of the parts certificate.

The maximum speed permitted by law when driving with snow chains is 50 km/h.

Snow chains should be removed when there is no snow on the road. There is no point in having them on the wheels, as they adversely affect the vehicle's handling. It causes unnecessary stress on the tyres and above average wear on the chains.

5 Tyre wear/ mileage for passenger car tyres

5.1 General

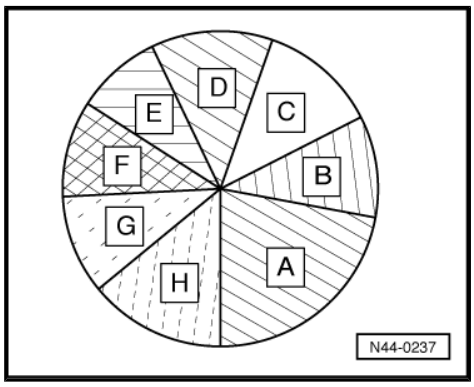
A tyre has to meet numerous requirements ⇒ page 20 .

Different types of tyres meet these requirements to varying degrees.

Depending on the conditions in which the tyres are used and on the type of vehicle, some requirements will be more important than others.

H, V, and Z tyres for “high-performance vehicles” are expected to have good grip on wet and flooded roads. However, mileage performance cannot be as good for tyres of this type as it is, for example, in the case of S or T tyres.

5.2 Requirements to be met by tyres



A - Wet braking properties

B - Driving comfort

C - Steering accuracy

D - Driving stability

E - Tyre weight

F - Life expectancy

G - Rolling resistance

H - Aquaplaning

The pie chart illustrates to what extent the tyre meets the various requirements. The tyre in this example (with its specific structure and rubber composition) would meet the requirements listed above (A to H) to the extent indicated by the size of the segments of the pie.

Improving one of the characteristics will have a negative effect on one of the others.

Example:

An improvement in wet braking properties -A- leads to a reduction in driving comfort -B-, rolling resistance -G- and life expectancy -F-.

The life expectancy of passenger vehicle tyres does not just depend on the rubber composition and design of a tyre. The conditions for use, the vehicle-specific circumstances and driving style have a heavy influence on the service life of a tyre.

Modern vehicles enable comfortable and economic driving, but also a more "sporty" driving style. A tyre life of 5,000 to 40,000 km or more is possible.

Note

The driving style is the most important influencing factor as regards the service life of a tyre.

5.3 Wear behaviour of high-speed tyres

These tyres are designed for very high speeds. When developing these tyres, good grip in wet conditions is the main objective. The tread compositions do not have the same wear resistance as T and H tyres for lower speeds.

The life expectancy of high-speed tyres is therefore considerably lower in comparable conditions of use.

5.4 Factors influencing the service life of a tyre

The following factors influence a tyre's service life to varying degrees.

Driving style:

5.5 Driving style

I. Steady driving without deceleration or acceleration

Example:

Speed (km/h)	Wheel slip	Wear
100	1	1
180	3	9

II. Braking (driving style)

Most wear is caused during braking.

100	0.1 x g	4	1
50	0.2 x g	8	4
12.5	0.4 x g [3]	32	2000 - 3000

2) g = Freefall acceleration: 9.81 m/s²

III. Acceleration (driving style)

Slip caused when driving off gently is approximately the same as that caused when driving at a constant speed of 100 km/h.

Example:

	Wheel slip	Wear
Driving off gently	1 - 2	1
Driving off normally	7 - 8	5
Driving off with wheels spinning	20 or more	100 - 200

IV. Driving through curves (driving style)

A »sporty« driving style and driving at higher speeds also cause greater wear when driving through corners.

In practice, this means that wear is increased 16-fold when the cornering speed is doubled. This is the price that has to be paid for going faster.

Example: Driving through a curve with a radius of 150 m

Speed (km/h)	Lateral acceleration (m/s²)[4]	Wear
50	1 = 0.13 x g	1
80	2.5 = 0.33 x g	6.5
100	4 = 0.53 x g	16

4) g = gravitational acceleration: 9.81 m/s²

5.6 Tyre maintenance

Tyre pressure

The weight of the vehicle causes the tyre contact area to flatten. This in turn causes the running surface and the entire ply of the tyre to be continually deformed when a tyre is rolling. If the tyre is underinflated, the amount of flex is higher, resulting in a greater increase in heat and increased rolling resistance. This then leads to increased wear and poses a greater safety risk.

Example: Specified standard tyre pressure with cold tyres, according to vehicle load

Tyre pressure (bar)	Tyre pressure (%)	Tyre life (%)
2.3	100	100
1.9	80	85
1.4	60	60
1.0	40	25

satelettronica

If tyre pressure is too high, this will result in poor rolling comfort and increased wear across the centre of the tread. We recommend always to maintain the tyre pressure specified by the manufacturer.

Note

- *The diagrams shown are not applicable in all cases.*
- *They are intended merely to give an idea of the wear rates of tyres on the front and rear axles and with front-wheel drive and four-wheel drive.*
- *The tyre service life may differ significantly, depending on operating conditions and running gear.*

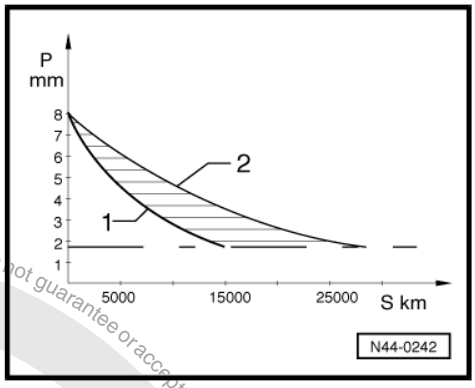

Diagram 1:

2 - Rear axle

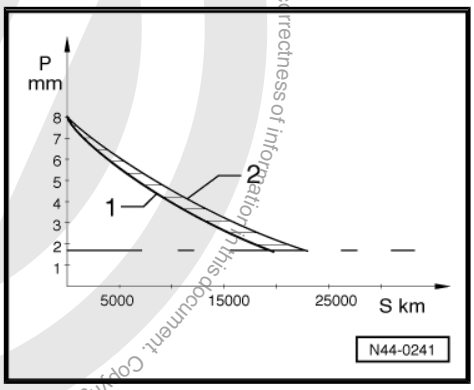

Diagram 2:

Tread depth over tyre service life for vehicles with four-wheel drive and V-rated tyres

P - Tread depth

S - Mileage covered

1 - Front axle

2 - Rear axle

Diagrams 1 and 2 show that the tread on a new tyre wears faster than that on a heavily used tyre. As the wear curve is not linear, it is not possible to estimate the tyre service life on the basis of wear after the first 5,000 km.

On front-wheel drive vehicles, the front tyres not only have to transmit the steering and driving forces, but also the greater part of the lateral and braking forces. This causes the front tyres on front-wheel drive vehicles to wear much faster than the rear tyres. Even tyre wear can be achieved by rotating (interchanging) the front and rear tyres on a regular basis. Rotating wheels ⇒ page 68 .

5.7 Evenly worn tyres

The requirements to be met by tyres are increasing continuously.

This is caused by the following factors:

- greater vehicle weight
- high speeds
- high level of vehicle safety

Greater loads on the tyre will, of course, lead to an increase in tyre wear.

Driving style has a critical effect on tyre wear. For this reason, customer claims regarding tyre wear on evenly worn tyres are not covered by the warranty.

The effective service life of a tyre can be determined only when the remaining tread depth has reached 2 mm (see diagrams ⇒ page 23).

5.8 Measuring tread depth

Note

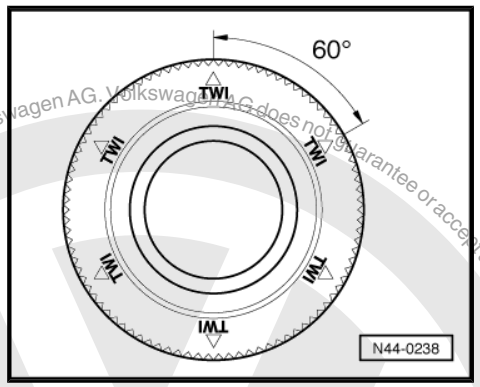
- *The tread depth is measured in the main tread channels.*
- *Do not measure at the TWIs (Tread Wear Indicators).*

Measure the tread depth in the main tread channel, at the points where the tyre is worn most heavily. The position of the TWIs can be seen at various points on the shoulder of the tyre ⇒ Item 2 (page 10) .

A “Δ” or the manufacturer's “logo” may appear in the place of “TWI”.

The bars of the TWI have a height of 1.6 mm. This is the minimum tread depth required by German law.

Different values may apply in other countries.



The TWIs must not be included in the measurement. Tread depth should always be measured at the deepest point of the tread channel.

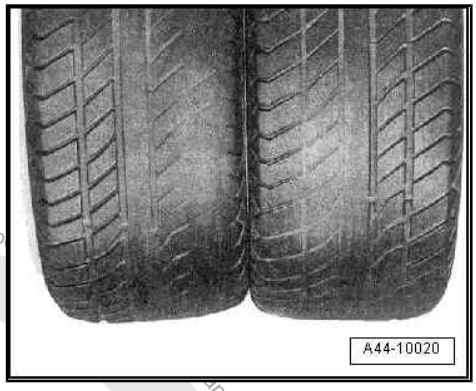
Increased one-sided wear



One-sided wear, usually in conjunction with signs of scuffing on the ribs of the tread and in the fine grooves, always occurs when the tyres have been allowed to roll with an extreme tyre slip angle, causing them to »rub« on the road surface.

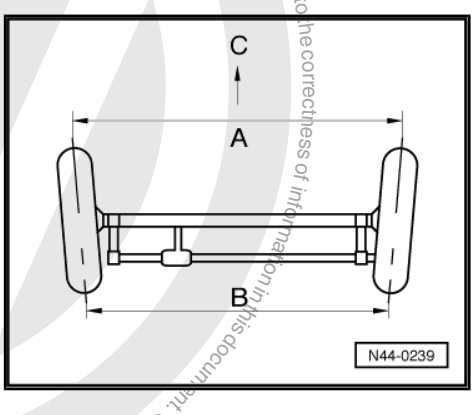
Driving fast on a stretch of road with lots of curves will cause increased wear, in particular on the outer shoulder.

A rounded outer shoulder on the tyre in conjunction with a particularly high degree of wear on the outer tread blocks indicates fast cornering. This wear pattern is influenced by driving style.

To optimise handling, the suspension is set to specified toe-in and camber values. Increased one-sided wear can be expected if tyres are allowed to roll under conditions which differ from those specified.

One-sided wear is especially likely if the toe and camber have not been set correctly. Moreover, there is a greater risk of diagonal washout.

Toe-out or negative toe-in



Distance between front of wheels -A- is greater than distance between rear of wheels -B- (-C- = direction of travel).

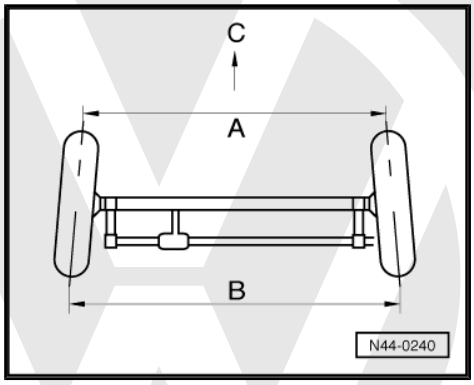
Toe-in or positive toe



Distance between front of wheels -A- is less than distance between rear of wheels -B- (-C- = direction of travel).

To prevent one-sided wear, care must be taken to ensure that the wheel is set within the tolerance specified by the vehicle manufacturer. The most frequent deviation of the wheel alignment is caused by external influences, for example hard contact with the kerbstone when parking.

By measuring the axle geometry, you can check whether the wheel alignment is within the specified tolerances or whether it has to be corrected.

Running gear modifications

Using “suspension-lowering kits” and/or alloy wheels that have not been recommended by VW may result in altered wheel positions which deviate from the specified alignment.

Even if the axle geometry is correct with the vehicle stationary during wheel alignment, the changed vehicle height and wheel positions can cause the wheel suspension to move differently during operation.

Uneven wear is then unavoidable.

Unsuitable use of self-levelling adjustments on pneumatic suspension system

The use of the offroad level is recommended only for driving offroad. Permanent use of the offroad level during normal road operation can lead to increased tyre wear as the height of the wheel position is different to the road level.

The way to prevent one-sided tyre wear is to ensure the wheel alignment is correct on one hand and on the other hand to make sure the vehicle is used only for its intended purpose:

Regular servicing of the vehicle and tyres helps to prevent tyre wear. The following should be noted in particular with regards to this:

- The prescribed minimum tyre inflation pressures must be adhered to.
- Different wear on the front and rear axle depending on the driving style is unavoidable. This condition can be compensated for by rotating the wheels from front to rear. The ideal opportunity to do this, for example, is during the seasonal change between winter and summer tyres. This change also has a positive side effect in that the tyres can wear down equally, meaning that a completely new set of tyres can be fitted. This prevents differences between the tread depths of the tyres on each axle, which can have negative effects on road holding.
- Saw tooth formation is a normal wear pattern, particularly if the driving style is very careful ⇒ page 30 . This can lead to increased rolling noise, which generally becomes better as the tread depth decreases. In the event of light saw tooth formation or if saw tooth formation is just starting, exchanging the wheels between axles is normally sufficient. If saw tooth formation is very pronounced, the wheels have to be changed in accordance with ⇒ page 30 so their direction of rotation is reversed.

- Some tread patterns may create an impression of premature wear: if winter tyre sipes or channels in the tread are worn down, only compact profile blocks without patterns remain, thus giving the impression of a worn tyre. In this case, the remaining tread depth must be measured in each groove. If this is at or below the minimum tread depth, the tyre can continue to be used without restrictions. (In Germany, the minimum is 1.6 mm; it is recommended, and in Austria, required, that winter tyres that are worn down to 4 mm be used only in summer)

5.11 Wear in middle of tyre

This wear pattern is found on the driven wheels of high-performance vehicles that are frequently driven long distances at high speeds.

At high speeds, centrifugal forces cause the tyre diameter to increase more in the middle of the tread than it does at the shoulder. This causes drive forces to be transferred to the road surface from

satelettronica

the centre section of the tread. This is reflected in the wear pattern.

Effects of this kind can be especially pronounced on wide tyres.

It is not possible to counter this wear pattern by reducing the tyre pressure.

> ⚠ **WARNING**
>
> ***For safety reasons, the tyre pressure must not under any circumstances be reduced below the specified tyre pressure.***

A more or less even tread wear pattern can be achieved by interchanging the tyres on the driven wheels and non-driven wheels in good time.

Increased tread wear

The typical tread wear pattern of tyres run on the driven wheels of a high-performance vehicle.

The increased wear in the centre section of the tread results from the extra loading associated with centrifugal forces within the tyre and the transmission of drive forces.

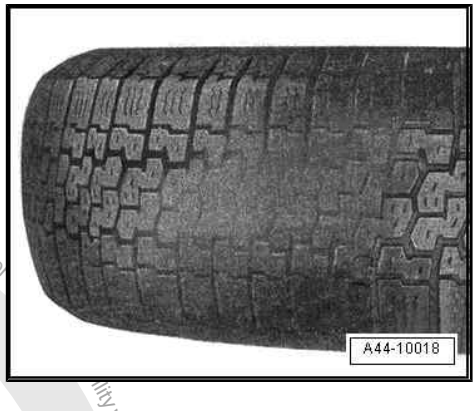
5.12 Diagonal washout



Diagonal washout on a tyre

Diagonal washout runs at an angle of approx. 45° to the direction of rotation.

It usually occurs at one point only, but can also occur at several points around the circumference of the tyre.

Washout occurs almost exclusively on the tyres on the non-driven wheels, in particular at the rear left. Washout occurs very often on some models, while it poses no problem at all on other models. The effect is intensified by high toe-in values. Toe-in values in the region of the lower tolerance limits of the specified alignment values improve the wear pattern.

The most pronounced diagonal washout is often found in the area where the tyre components are joined.

Wheels with positive toe-in roll with a slip angle even straight ahead. This leads to a diagonal stress in the contact patch or footprint on the tyre/road surface.

This wear pattern is intensified when tyre pressure is too low. To avoid such tread wear patterns, the toe-in values of the two rear wheels should be identical and the specified tyre pressures observed.

If you detect washout, you should fit the wheels on the driven axle, assuming the washout is identified at an early stage. Deeper washout cannot be repaired.

Faulty adjustment

If a customer complains of “diagonal wear spots”, the toe adjustment must be examined. If toe-in is correct, the cause of the diagonal washout is very probably the tyre itself.

Tyres with diagonal washout caused by incorrectly set axle geometry at the wheels are not covered by warranty.

6 Tyre noise

6.1 General notes on tyre noise

Tyre noise that can be heard by the human ear is caused by vibrations which are transmitted by the air from the source of the sound to our ears.

Of interest here are the noises caused by certain characteristics and effects while the tyres are rolling (source of the sound).

The cause of the noise is largely dependent on the combination of the road surface and tyres.

The structure and material of the road surface will greatly affect tyre noise. For example, the noise level on a wet road is much higher than on a dry road.

The pattern of the tyre tread also has a significant influence on tyre noise. Tyres with transverse grooves at an angle of 90° generate more noise than tyres with grooves running diagonally.

Small tread blocks are unstable. Their highly pronounced deformation agitates the air as the tyres roll. This creates the air vibrations that cause tyre noise.

Wider tyres are louder. They need more tread channels to displace water. When they are rolling, these tread channels displace the air, also creating air vibrations.

Further effects that also influence tyre noise:

- “Tyre vibration” is the principal cause of tyre noise. It is caused by the columns of air in the tread channels being agitated.
- “Air pumping” is the compression and expansion of the air caused by the deformation of the tread blocks as the tyre contact patch moves along the road surface.

Useful information regarding tyre noise

Tyre noise is determined primarily by the tyres and the road surface.

The roughness, structure and material of the road surface influence tyre noise.

The widths of the tyre and the rim, among other things, influence tyre noise. Due to their larger contact area, wider tyres will cause more tyre noise than narrow tyres, as more air has to be displaced and more “mass” is agitated to create vibrations.

A wider wheel rim will also cause a tyre to have a wider contact patch. The effect on tyre noise is thus very similar to that of a wider tyre. Moreover, the damping characteristics of the tyre may also be adversely affected by the wider wheel rim.

On vehicles with a front-mounted engine, tyre noise is more perceptible at the rear of the vehicle, as wind and engine noises are not as loud there.

6.2 Saw-tooth wear

Saw-tooth wear is a stepped wear pattern on the individual tread blocks ⇒ page 31 that can cause increased tyre noise. The saw tooth is caused by uneven deformation of the tread blocks in the tyre's contact patch. Saw-tooth wear is more pronounced on non-driven wheels than on driven wheels.

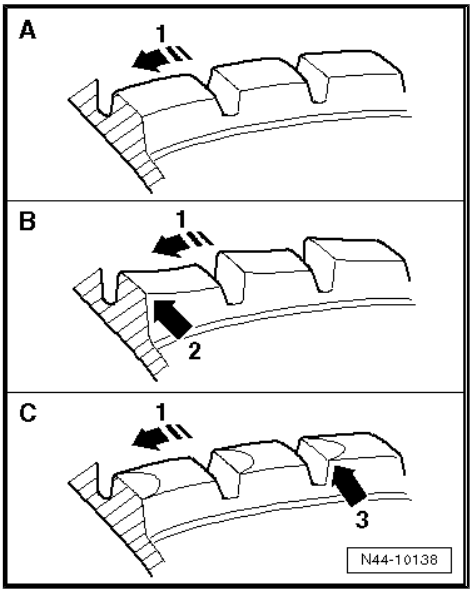
satelettronica

New tyres are more susceptible to saw-tooth wear because of the greater elasticity of the high tread blocks. As the tread depth decreases, the tread blocks become more rigid and the tendency to wear in a saw-tooth pattern decreases.



Appearance of saw tooth

A - Tread block of a new tyre; seen in direction of motion -arrow 1-, tread blocks are equally high in front and back.

B - Development of saw teeth; seen in the direction of rotation -arrow 1-, tread blocks are higher in front -arrow 2- than in back.

C - Seen in the direction of rotation -arrow 1-, tread blocks show greater wear in the front section of the “saw tooth” -arrow 3-.

Pronounced saw-tooth wear can lead to customers complaining about tyre noise.

Pronounced saw-tooth wear occurs under the following conditions:

- toe values are too high
- tyre pressures are incorrect
- tread is coarse and open
- tyres are fitted on the non-driven axle
- very fast cornering.

non-directional tyres

In the event of saw-tooth wear, the direction of rotation of the tyre must be reversed. If saw-tooth wear is especially pronounced and tyre noise has increased, interchange the tyres diagonally. This will reduce the saw-tooth effect.

On front-wheel-drive vehicles, this effect is intensified by the greater wear on the front axle.

Tyre noise will be somewhat louder immediately after the tyres have been interchanged but will return to a normal level after about 500…1,000 km have been driven.

Directional tyres

In the event of increased saw-tooth wear on the rear tyres – in particular on front-wheel drive vehicles – interchange the front and rear tyres. In the event of increased saw-tooth wear on the outer edges of the tyres on one axle, turn both tyres around on their rims. The left-hand wheel must then be fitted on the right side of the vehicle and the right-hand wheel on the left side.

6.3 Flat spots (from locking wheels)

Flat spots can result from an extreme brake application which causes the wheels to lock, so that the rubber is worn off at the contact patch between the tread and the road surface.

As the tyres slide over the road surface, friction generates heat, which also reduces the wear resistance of the tread material.

Not even a highly wear-resistant tread compound can prevent the flat spots caused by violent braking.

Even ABS-controlled brake systems cannot prevent brief locking of the wheels, and thus, minor flat spots.

The degree of such wear depends largely on the vehicle speed, the road surface and the load placed on the wheel. The following examples should make this clear.

If a vehicle is braked to a standstill on a dry surface with the wheels locked, the amount of rubber worn from the tyre will cover an area the size of a postcard and will have a thickness of:

- up to 2.0 mm from a speed of 57 km/h (23.8 m braking distance)
- up to 3.3 mm from a speed of 75 km/h (41.8 m braking distance)
- up to 4.8 mm from a speed of 92 km/h (71.6 m braking distance)

Flat spots in tread

Tyres with such damage must no longer be used and must be renewed.

7 Rough running caused by wheels/ tyres

7.1 Causes of rough running

Rough running can have a number of different causes. It can also be caused by tyre wear. Tyre wear caused by driving is not always evenly spread across the entire running surface of the tyre. This causes slight imbalances which affect the smooth running of a wheel which was previously exactly balanced.

Minor imbalances will not be felt at the steering wheel, but that does not mean that they are not there. They increase wear on the tyre and thus reduce the tyre service life.

Recommendation

To ensure

- optimal safety,
- smoothest possible running and
- even wear

throughout a tyre's service life, we recommend having the wheels and tyres balanced at least twice during the tyre's service life.

7.2 Balancing wheels

Before you start balancing the wheels, the following requirements must be met.

- The tyre pressure must be OK.
- The tyre tread must not show one-sided wear and should be at least 4 mm deep.
- The tyre must not show any signs of damage, for example cuts, piercing, foreign bodies, etc.
- The wheel suspension, steering and steering linkage, including the shock absorbers, must be in perfect condition.
- You must have conducted a road test.

7.3 Conducting a road test before balancing wheels

If a customer brings a vehicle to the workshop complaining about “vibration”, a road test is essential prior to balancing the wheels.

♦ This will give you information about the nature of the rough running.

♦ You will be able to determine in which speed range the rough running occurs.

– Raise the vehicle on a lifting platform immediately after the road test.

– Mark the positions of the tyres on the vehicle.

Tyre position	Marked with …

Front right tyre	FR
Rear left tyre	RL
Rear right tyre	RR

– Remove wheels from vehicle.
– Balance the wheels.

7.4 Balancing wheels on stationary wheel balancing machine

Clamp wheel into wheel balancing machine

Note

When balancing wheels, please remember that cleanliness is absolutely essential, as indeed it is in the case of any other repair work you carry out. Only then can you attain a flawless result!

Dirt and rust in the area of the contact surfaces and centre of the wheel distort the result.

– Clean the contact surfaces, the centre of the wheel and the recess on the inside of the wheel before mounting the wheel on the wheel balancer.
– Mount the wheel with tyre on the wheel balancer.

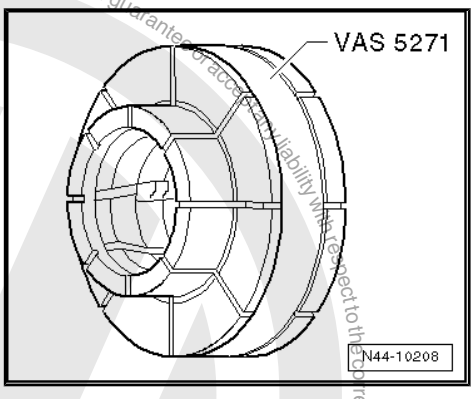
satelettronica



Note

- *To clamp the wheel, use e.g. centring system for wheel balancing machines - VAS 5271- .*
- *This ensures that the wheel is 100% centred and that the wheel will be clamped without damage!*
- *The wheel cannot be centralised 100% with conical clamping elements on the wheel balancing machine.*
- *A deviation of 0.1 mm from the centre results in an imbalance of 10 grams at the wheel/rim.*

Procedure for balancing wheels and tyres

– Rotate wheel and tyre on wheel balancer.

– Check that the indicator lines on the sidewall of the tyre near the wheel rim flange run evenly.

– Check that the body of the tyre runs evenly while the wheel and tyre are rotating.

Note

If one-sided wear, flat spots from braking or severely washed out spots are apparent, balancing cannot achieve smooth running. In this case, the tyre must be renewed.

– Check the true running of the wheel and tyre. If the wheel and tyre do not run true although there are no flat spots, radial or lateral runout may be the cause.

– Check the wheel for radial or lateral runout ⇒ page 37 .

– If radial and lateral runout are within the specified tolerance, balance the wheel and tyre.

Note

- *More than 60 grams of weight per tyre should not be used.*
- *If more weight is required, you may be able to achieve smoother running by "matching" the tyre and rim. Matching tyres* *⇒ page 39* *.*
- *The wheel balancer display should indicate 0 gram.*
- *As an alternative to match mounting, you could use the vibration control system - VAS 6230-* *⇒ page 36* *.*

– Bolt the wheel to the vehicle.

– First hand-tighten the lowest wheel bolt to about 30 Nm.

– Then tighten the remaining wheel bolts diagonally to about 30 Nm. This process centres the wheel on the hub.

– Lower vehicle onto its wheels.

– Now use a torque wrench to tighten the wheel bolts diagonally to the specified torque.

Carry out road test

– After balancing the wheels and tyres, carry out a road test.

satelettronica

If you detect vibration during the road test, it may be due to tolerance in the wheel centring.

In unfavourable circumstances, the component tolerances of wheels and hubs could cumulate. This too can lead to vibration. This can be alleviated using a finish balancer. ⇒ page 36

7.5 Vibration control system - VAS 6230-

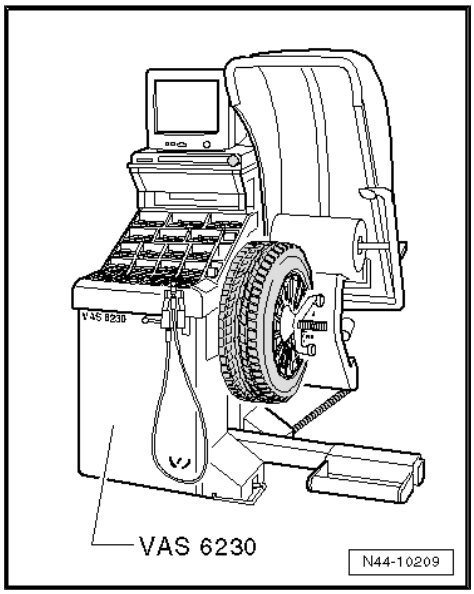
Using the vibration control system - VAS 6230- you can perform more functions than just stationary balancing.

A special feature of this system is the testing of the radial force of the wheel and tyre while rolling.

A roller presses against the wheel with a force of about 635 kg. This simulates the vertical tyre force against the road surface during travel.

Radial and lateral runout in the wheel and tyre and differences in the stiffness of the tyre cause the vertical force of the wheel to vary.

The -VAS 6230- detects and stores the position of the maximum measured radial force in the tyre. Then the position of the smallest distance between the wheel rim flange and the centre of the rim is measured.



7.6 Finish balancer

Note

- *Before working with a finish balancer , the mechanic needs to have been instructed by the manufacturer of the balancer.*
- *To balance the wheels, set the wheels of the driven axle on the sensor platforms (only the front wheels of a front-wheel drive vehicle, all four wheels of a four-wheel drive vehicle).*

If you determine a residual imbalance greater than 20 grams when balancing the wheels, you should rotate the mounting position of the wheel on the hub.

– Mark the point at which the imbalance is indicated.

– Unbolt the wheel and rotate its position on the hub so that the marking points downwards.

Note

The hub must not rotate during this procedure.

– First hand-tighten the lowest wheel bolt to about 30 Nm.

– Then tighten the remaining wheel bolts diagonally to about 30 Nm. This process ensures that the wheel is centred properly on the hub.

– Check whether the imbalance is less than 20 grams using the finish balancer.

Protected by copyright. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.
satelettronica

Note

The imbalance should always be less than 20 grams before you change the balance weight.

– If necessary, remove the wheel bolts again.
– Rotate the wheel relative to the hub once more, turning it one or two wheel bolt holes further.
– Tighten the wheel bolts using the method described above.

Note

Do not try to reduce the imbalance using balance weights until the imbalance is less than 20 grams.

– Balance the wheels until the imbalance is less than 5 grams.
– Tighten wheel bolts to specified torque if you have not already done so.

WARNING

Always tighten wheel bolts to specified torque using a torque wrench!

7.7 Radial and lateral runout of wheels and tyres

Radial and lateral runout occur when the wheel and tyre do not run absolutely true.

For technical reasons, 100% true running is not possible.

Therefore, the manufacturers of these components allow a precisely determined tolerance.

Mounting the tyre in an unfavourable position on the wheel can cause the maximum allowed tolerance for wheel with tyre to be exceeded.

The table shows the maximum permissible tolerances for a wheel with mounted tyre.

Tolerances for radial and lateral runout of wheels with tyres

Wheel with tyre	Radial runout (mm)	Lateral runout (mm)
Passenger cars	0.9	1.1 (1.3 in vicinity of lettering)

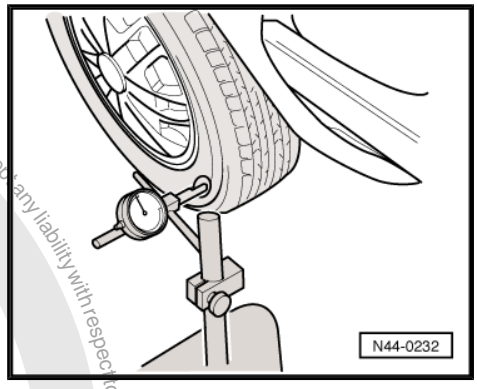
7.8 Checking radial and lateral runout on wheels and tyres with tyre gauge - V.A.G 1435-

Checking lateral runout

– Preload tyre gauge about 2 mm.

Copyright by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG. Volkswagen AG is not permitted unless authorised

– Set tyre gauge against sidewall of tyre.
– Slowly rotate the wheel.
– Note the smallest and the largest dial readings.



Note

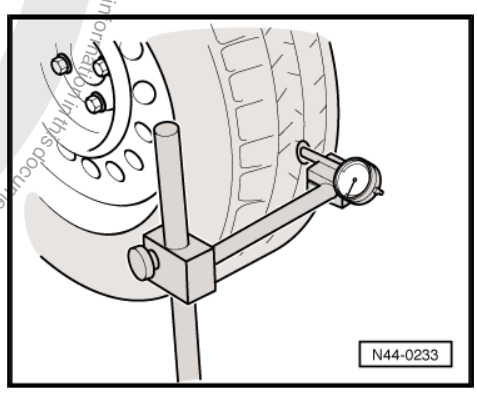
If the difference is greater than 1.3 mm, the lateral runout is too great.

In this case, you can reduce lateral runout by match mounting the tyre ⇒ page 39 .

Extreme values on the tyre gauge due to small irregularities in the rubber may be disregarded.

Checking radial runout

– Preload tyre gauge about 2 mm.
– Set the tyre gauge against the tyre tread.
– Slowly rotate the wheel.
– Note the smallest and the largest dial readings.



Note

If the difference is greater than 1 mm, the radial runout is too great.

In this case, you can reduce radial runout by match mounting the tyre ⇒ page 39 .

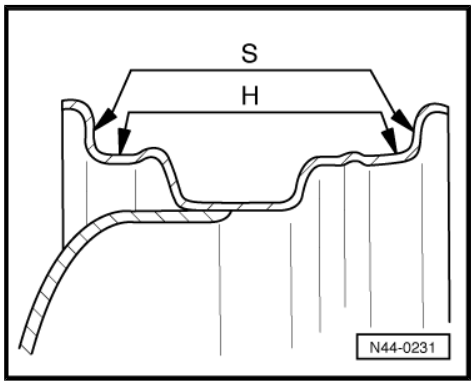
7.9 Checking radial and lateral runout on wheel rim

– Mount the wheel on the wheel balancer .
– Use the wheel balancing machine centring system - VAS 5271- .
– Preload tyre gauge about 2 mm.
– Slowly rotate the wheel.
– Note the smallest and the largest dial readings.

S - Lateral runout

H - Radial runout

– Compare the measured values with the specifications in the table ⇒ page 38 .



Note

Extreme values on the tyre gauge due to small irregularities may be disregarded.

Specifications for radial and lateral runout on wheel rim

Wheel rim		Radial runout (mm)	Lateral runout (mm)
Passenger cars	Steel wheel	0.5	0.5

satelettronica

Wheel rim		Radial runout (mm)	Lateral runout (mm)
	Alloy wheel	0.5	0.8
Sharan	Steel wheel	0.5	0.8
	Alloy wheel	0.5	0.5

Note

If the measured value exceeds the specification, acceptably smooth running cannot be attained.

7.10 Matching

General

When radial or lateral runout of the wheel and tyre coincide, the imbalance of the wheel is amplified by the tyre.

For technical reasons, 100% true running is not possible ⇒ page 37 .

Before match mounting the used wheels which are fitted on the vehicle, run the tyres warm. This will eliminate any flat spots caused by storage or handling, ⇒ page 40 .

Procedure for match mounting

– Deflate the tyre.
– Press the tyre beads off the rim flanges.
– Coat the tyre bead all round with tyre fitting paste .
– Rotate the tyre 180° relative to the wheel.
– Inflate the tyre to approx. 4 bar.
– Mount the wheel with tyre on the wheel balancer.
– Check true running, that is, radial and lateral runout.

Note

- *If the specified values for radial and lateral runout are not exceeded, the wheel can be balanced to 0 gram. Specified values appear on ⇒ page 37 .*
- *If the radial and lateral runout is not within the specifications, the tyre must be rotated again.*

– Deflate the tyre and press off the tyre beads from the rim flanges.
– Rotate the tyre 90° with respect to the wheel (1/4 of a turn).
– Inflate the tyre to 4 bar again and check true running.

Note

- *If the specified values for radial and lateral runout are not exceeded, the wheel can be balanced to 0 gram.*
- *If the radial and lateral runout are not within the specified values, the tyre must be rotated again.*

– Press the tyre off the rim flanges again as described above.

– Rotate the tyre 180° with respect to the wheel (1/2 a turn).

If the radial and/or lateral runouts are still not within the specifications, check the radial and/or lateral runouts of the wheel: ⇒ page 38 .

If the measured values for radial and lateral runout of the wheel are within the specified values, the tyre has an impermissibly high radial or lateral runout. In this case, the tyre must be renewed.

Note

- *After fitting the tyres there will be fitting lubricant between the tyres and the rim flanges.*
- *Therefore, severe braking and acceleration manoeuvres must be avoided for the first 100 or 200 km driven. The tyres may otherwise rotate on the rims and your work will have been in vain.*

7.11 Flat spots caused by storage or handling

What is a flat spot?

The terms flat area and flats are also used for the term flat spot.

Flat spots caused by storage or handling also cause vibration in the same way as incorrectly balanced wheels do. It is important that flat spots on the tread are identified as such.

Flat spots caused by storage or handling cannot be balanced and they can reoccur at any time due to various circumstances. Flat spots caused by storage or handling can be eliminated without complicated special tools. This does not apply to flat spots caused by hard braking ⇒ page 31 .

Note

Flat spots caused by hard braking cannot be repaired. Such tyres must be renewed.

Reasons for flat spots caused by storage or handling:

- The vehicle has been left standing in one place without being moved for several weeks.
- The tyre inflation pressure is too low.
- The vehicle was placed in a paint shop drying booth after being painted.
- The vehicle was parked with warm tyres in a cool garage or similar for a long period of time. In this case, a standing flat spot may even occur overnight.

Eliminating flat spots caused by storage or handling

- Flat spots caused by storage or handling cannot be eliminated from the tyre using workshop equipment.
- Flat spots caused by storage or handling can be removed only by running the tyres warm.
- The method described below is not recommended in cold and wintry weather.

Requirements and conditions:

– Check and, if necessary, correct inflation pressures.

8 Vehicle pulls to one side

8.1 General

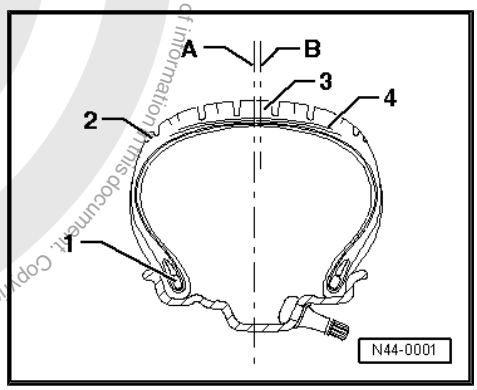
Perform a road test to determine whether a vehicle is pulling to one side and if so, which side. If the vehicle pulls to one side ⇒ page 43 .

When wheel alignment is checked, include the wheel alignment test results in tyre complaint report.

Manufacturer's tolerances can lead to a slight amount of taper (asymmetry) in the tyre carcass. The rolling tyre then develops a lateral force which acts directly on the wheel suspension, leading to self-steering of the vehicle. Strategic rotation of the wheels can balance out this self-steering behaviour.

8.2 Conicity

Conicity is caused by a slight offset of the tread and/or the belt (amounting to a few tenths of a millimetre) relative to the geometric centre of the tyre. Taper is not visible and cannot be measured with equipment available in the workshop.



Parts of a tyre

1 - Bead

2 - Shoulder

3 - Tread

4 - Steel cord belt

A - Geometrical centre of tyre

B - Actual centre of belt. It can be offset to inside or outside.

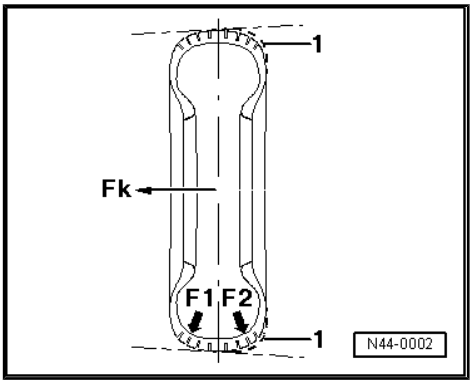
satelettronica



Exaggerated for clarity.

1 - Offset of belt and tread

F1 - Unequal vertical wheel forces

F2 - Unequal vertical wheel forces

Fk - Conicity force

The offset produces differences in stiffness at the inner and outer shoulders of the tyre, resulting in differing vertical wheel forces. Consequently the belt or tread will not be pressed onto the road surface with the same force (F1, F2). A conical, or tapered, shape develops. The resulting force (conicity force Fk) can, depending on the speed, become so great that the vehicle then pulls to one side.

If the force Fk on one wheel of the axle is, for example, 50 Newton, and also 50 Newton on the other wheel, and both forces are exerted in the same direction, the forces are cumulated. Reversing a tyre on the rim can compensate for the lateral pull because the forces then act in opposite directions.

Because the direction in which the force of taper is exerted is not visible, only road tests and strategic rotation of wheels and tyres can establish which tyres cause the pulling.

The tyre consists of numerous components and materials which are vulcanised to form a single part at the end of a complicated manufacturing process. The result is differing production tolerances which make themselves noticeable through more or less strong lateral forces (conicity forces). These forces can also occur in new tyres.

Pulling to one side on front axle

Pulling to one side can be caused by the running gear. However, experience shows that in 90% of all complaints, the tyres cause pulling to one side.

Pulling to one side during normal driving

On a straight, level road surface, the vehicle wants to pull to one side at a constant speed or with moderate acceleration. Force can be felt at the steering wheel.

Pulling to one side during fast acceleration

Pulling to one side during fast acceleration is, in part, due to the basic design of vehicles with front wheel drive. Different friction levels at the left and right wheels or possible irregularities in the road surface (potholes) and consequently varying road adhesion have a substantial influence on the handling characteristics. This does not constitute a complaint which is covered by the warranty.

8.3 Remedies when vehicle pulls to one side

Test conditions before and during the road test:

- Check all suspension components on the front and rear axles for damage.
- Check tyre pressure and correct if necessary.
- Check the tyres for external damage. Punctures, cuts, bubbles on the sidewalls, flat spots from braking and/or damage to the tread.
- Ask the customer if the tyre had been damaged by a nail or similar object and was repaired by a tyre dealer. It may be necessary to renew such tyres.

satelettronica

– Check tyres for even wear and tread depth.
– Are all tyres of the same type, manufacture and tread pattern?
– If the tyres are non-directional, ensure that all DOT classifications on the tyre face outwards. The wheels and/or tyres on the vehicle may have already been changed around at an earlier date.
– Is the make of tyre approved by the factory as original equipment?
– Perform the road test on a road which is level, straight and ungrooved and does not drop off to one side.
– Perform the road test with the customer under the conditions specified above. Ask the customer to demonstrate the problem.

Note

There must be no cross wind during the road test.

If the complaint is justified, we recommend rotating the wheels and tyres as described below.

Before you begin, observe the following notes; otherwise your efforts may not have the desired effect.

Note

- *Mark the tyres before the first rotation, e.g. FR, FL, RR, RL.*
- *After rotating wheels or reversing the tyre on its rim, you must observe very carefully how the vehicle behaves during the road test. Note how and what was changed.*
- *Assess the intensity of or a possible change in the tendency to pull to one side.*
- *For this purpose, it is important that the road tests are always performed by the same person on the same road. It is best to drive the "test course" in both directions.*
- *Replacing a tyre with a new tyre does not guarantee that pulling to one side will be eliminated. Therefore it is recommended as a first step to carry out the strategic rotation of the wheels as described below.*
- *If there are large differences in the tread depth of the tyres on the front and rear axles, the tyres with the deeper tread should always be mounted on the rear axle.*

9 Tyre damage

9.1 General information

As tyre damage can have serious consequences, you and the driver should regularly check the tyres to identify any problems at an early stage.

Damaged tyres cannot withstand driving conditions such as high speed, long distances, sporty driving, and so on.

Damage can be caused in a number of ways:

- Driving with insufficient tyre pressure
- Assembly error when tyres were fitted on rims
- Damage by embedding objects
- Ageing
- Improper storage

WARNING

Whenever a safety risk cannot be ruled out, the tyre must be renewed.

The nylon ply -4-, belt layers -5-, bead cores -6- and bead filler -7- form the carcass. The carcass is the “load-bearing structure” of the tyre.

9.3 Impact damage

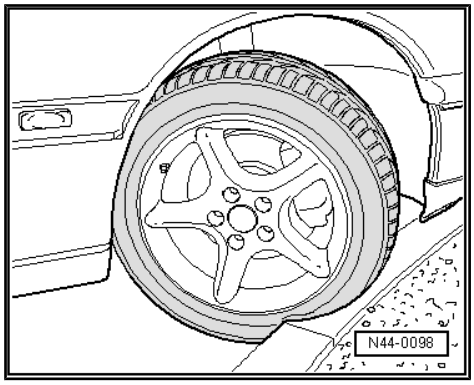
A swelling in the sidewall of the tyre indicates that the substructure of the carcass has been damaged.

Typical causes for such damage include, for example, driving over kerbs at a sharp angle.

Pinching the tyre in this way can damage the carcass.

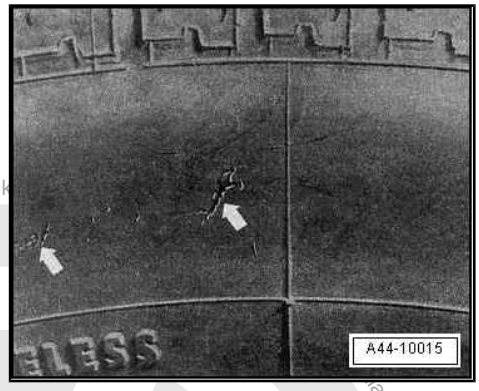
The substructure of the tyre is stretched so far that individual fibres in the carcass may be broken.

The extent of the damage depends on the speed of impact, the angle of impact, the tyre pressure, the axle load and the type of obstacle.



satelettronica

Pinch marks on tyre sidewall -arrows-

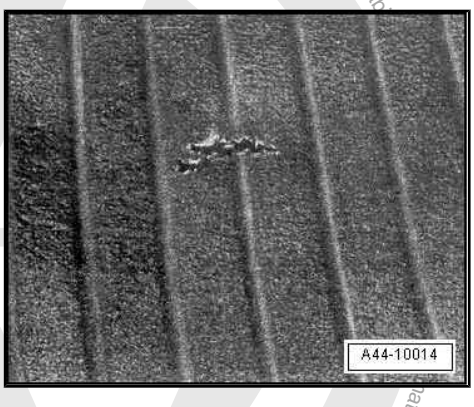


Note

- *Driving over kerbs should be avoided.*
- *If you cannot avoid driving over a kerb, you should do so very slowly and as square-on as possible.*

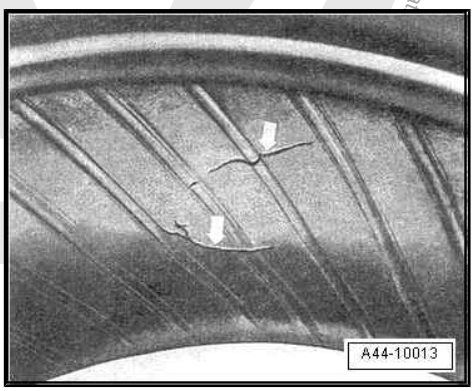
Interior view of a tyre with a punctured carcass

Due to a severe impact, the carcass was pinched on the wheel rim flange and is ruptured in the contact area.



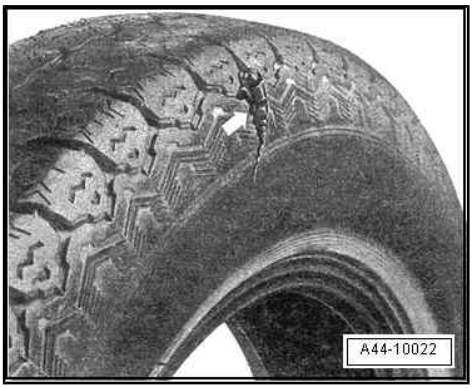
Damage inside tyre due to impact injury (double rupture)

Double rupture -arrows- caused by pinching when a kerb was driven over. Often not detectable from outside.



9.4 Cuts

Cut caused by a sharp-edged obstacle -arrow-



9.5 Damage caused by foreign bodies

Driving over hard, pointed objects like nails, screws and the like can pierce the tyre.

This always leads to tyre damage.

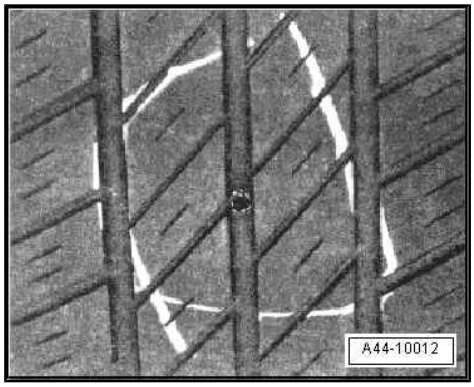
satelettronica

Damage due to embedded foreign body



Often, the object -marking- is so securely embedded in the tyre that it will not free itself even at higher speeds. Consequently, it can act as a plug and seal the tyre relatively well. This results in a gradual loss of pressure, which the driver will not notice immediately, but which can lead to sudden and complete tyre failure.

Note

No repair should be attempted on a steel-belted tyre of which the structure has been punctured by a foreign body.

9.6 Loss of air from tyre

If the customer complains of a loss of air from a tyre, it is essential that you check for embedded foreign bodies.

Note

No repair should be attempted on a steel belted tyre of which the structure has been punctured by a foreign body.

Corrosion can develop on the steel wires. This will always lead to the separation of the rubber from the steel belt.

Generally, one cannot determine when the foreign body was embedded. The tyre structure may already have been damaged as a result of driving with insufficient tyre pressure.

Damaged belt wires will sooner or later lead to separation of the rubber from the steel belt. As a result, the tyre can fail completely at some point long after the tyre was first damaged.

Tyre damage caused by foreign bodies is not covered by the warranty.

9.7 Tyre pressure

The tyre pressure must be checked regularly. We recommend checking the tyre pressure every two weeks. The correct tyre pressure is especially important on long trips or when carrying a heavy load. A sporty driving style also requires correct or even slightly increased tyre pressure.

Slow loss of tyre pressure

The slow loss of tyre pressure is especially problematic because even experienced drivers often do not notice it.

Insufficient tyre pressure and the related increase in flexing (internal friction) cause the tyre material to heat up considerably and may lead to the separation of the various components and rubber compounds.

In the end, the tyre is usually destroyed completely ⇒ page 51 .

The cause for the slow pressure loss cannot always be determined because the tyre is severely damaged and structural components of the tyre are missing.

satelettronica

9.8 Tyre damage due to insufficient tyre pressure

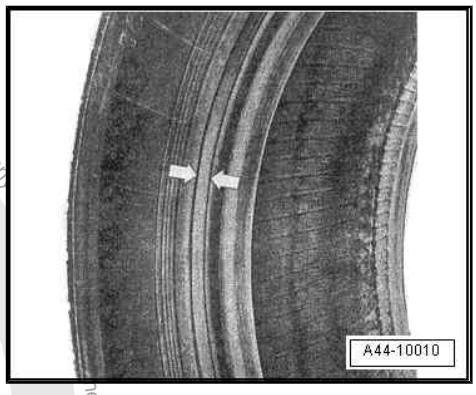
The most common causes for tyre failure are minor external damage, a defective valve or a leaking rim due to corrosion or damage.

Separation of carcass and rubber

Excessive heating due to driving with substantially insufficient tyre pressure ⇒ page 52 led to overheating and subsequent separation of the carcass from the rubber material -arrows-.

The tyre shown here was periodically driven with an inflation pressure which was insufficient for the load. Typical evidence for this is the circumferential scuffing along the bead caused by the wheel flange and also the discolouration. Small, furrowed creases are visible along the inside of the sidewall.

When the tyre rolls, strong shear forces develop between the layers of steel cord, especially at the ends of the belts.



Tyres with wide, circumferential furrows near the bead

Wide, circumferential furrows near the bead -arrows- indicate that the tyre was driven with insufficient pressure.

Driving a vehicle with insufficient tyre pressure or ignoring or not recognising tyre damage can have serious consequences.

The tyre can no longer withstand the forces which develop when the vehicle is driven.

The defects mentioned above severely restrict the function of the tyre. The rubber compounds separate, which results in the partial separation of tyre components or even its complete destruction.

Tyres with stripped profile

Such damage usually develops over a longer period of time. If an already damaged tyre is exposed to high stress, the centrifugal forces which occur at high speeds can tear components off the tyre.

The figure shows a tyre with stripped tread due to travel with insufficient tyre pressure.

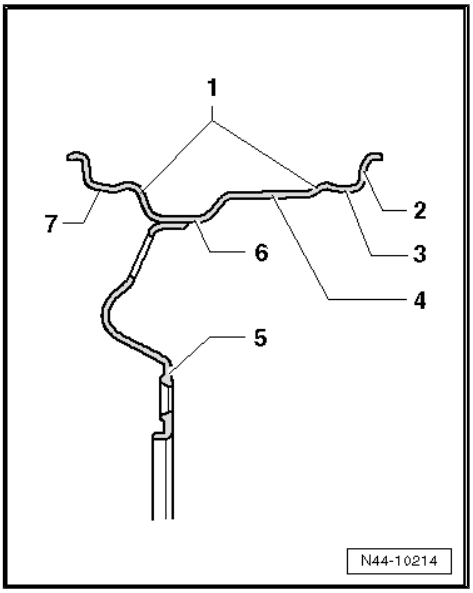
9.10 Tyre damage due to fitting error (fitting damage)

Bead core broken during tyre inflation.

Modern radial tyres for passenger cars are mounted only on safety rims. Safety rims have a hump -1- running along the bead seat.



1 - Hump (double hump H 2), extended double hump (EH2)

2 - Wheel rim flange

3 - Inner rim shoulder (e.g. tapered rim shoulder)

4 - Rim

5 - Wheel

6 - Well

7 - Outer rim shoulder (e.g. tapered rim shoulder)

The hump prevents the tyre from being pressed out of the rim shoulder during travel with insufficient tyre pressure.

When the tyre is inflated, the bead of the tyre may not slip completely over the outer rim hump.

In this case, there is a danger of the bead core becoming overstretched if the tyre pressure is too high. The steel wires would then rupture partially or completely. A broken bead core cannot be detected from the outside.

Special requirements for tyres with run-flat properties

Wheel rims with a raised double hump (Extended Hump EH2) are prescribed for tyres with run-flat properties (reinforced side walls) ⇒ page 59 . The raised double hump prevents the deflated tyre from slipping off its seat on the wheel rim when the tyre is run deflated.

Note

To avoid damage, always observe the notes/instructions when fitting/removing tyres with run-flat properties ⇒ Running gear, axles, steering; Rep. gr. 44 ; Fitting and removing tyres with run-flat properties .

WARNING

- ***Tyres with damaged bead cores are not seated safely and securely on the rim. Such tyres are a safety risk!***
- ***In addition, there is a risk of the partly broken bead core breaking apart during continued operation and the tyre could suddenly tear open. If the bead core breaks during inflation, the carcass will also be destroyed.***

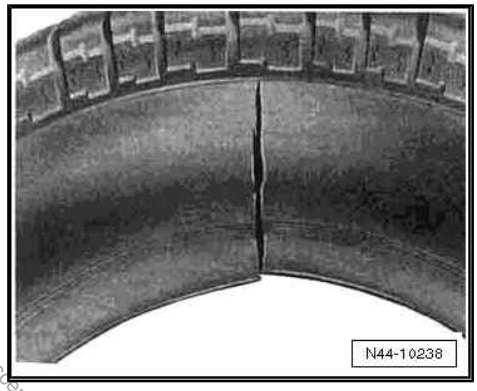
Tyre with broken bead core and destroyed carcass



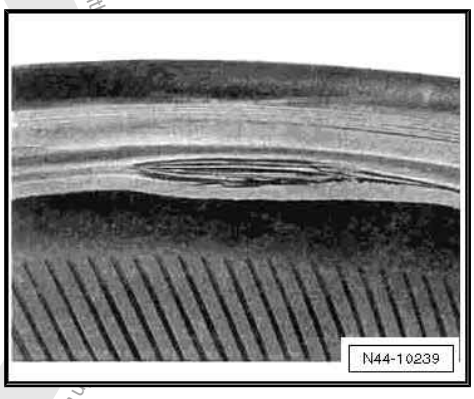
The figure shows a tyre with a broken bead core and destroyed carcass as a result of excess pulling force during fitting.

Bead damage due to faulty or incorrect tyre fitting with tyre-fitting machine

The following errors, which may occur when tyres are fitted, can lead to severe tyre damage:

- If the opposite tyre bead is not seated completely in the rim well when the upper bead is rolled in on the tyre fitting machine. ⇒ page 53.
- If the fitting head is improperly adjusted.
- If the edge of the fitting roller rolls onto the bead.
- If the guide rollers are worn or have sharp edges.

If the tyre bead is split.



In these cases, the bead, which is under great tension, can be cut into in the direction of rotation, split and/or be pinched off down to the core wire.

It is often possible to identify the tracks of the guide roller as it was applied or ran off where the damage occurred.

Note

Both tyre beads as well as the rim shoulders must always be coated with assembly paste .

If fitting damage remains undetected, there is a danger that the tyre will fail later during operation.

THEREFORE!

- Never fit a tyre without using assembly paste .
- Do not allow the bead seating pressure to exceed 3 bar.
- Do not allow the tyre inflation pressure to exceed 4 bar.
- When the tyre has been fitted, reduce the tyre pressure to the specified value.

10 Tyres with run-flat properties

10.1 General

Tyres with run-flat properties have reinforced side walls when comparing them with normal tyres. This reduces the slippage of the side walls and prevents the tyre flanks sticking when the tyres are run deflated. This ensures the vehicle remains controllable and the vehicle has almost normal driving characteristics. The alleviates the necessity to fit the spare wheel in dangerous conditions e.g hard shoulder of a motorway or in bad weather conditions.

A deflated tyre can be driven further to the next workshop (approx. 50 km (approx. 30 miles)) at a suitable speed (max. 80 km/h (max. 50 mph)) and in suitable driving style for the conditions, see ⇒ Owner's wallet .

After checking the respective wheel, the responsibility lies with the driver to decide if it is safe to drive further with the deflated tyre.

-I- Tyres with normal air pressure

1 - Tyres with run-flat properties (reinforced side walls -red-)

2 - Normal tyres

-II- Deflated tyre

When a normal tyre -2- deflates, the side walls are pressed against the wheel rims. The side walls heat up extremely or stick and are therefore destroyed when the tyre is deflated.

Tyres with run-flat properties -1- are supported on the reinforced side walls (-red-). A special tyre mixture and the reduced walkability of the reinforced side walls reduces the heat created when the tyre is run and the vehicle remains controllable.

10.2 Design and identification

Identification

Distinguishing features: tyres with run-flat properties can be identified by one of the following abbreviations DSST, Euforia, RFT, ROF, RSC, SSR or ZP. The abbreviation is located on the flank of the tyre following the tyre designation of the respective tyre manufacturer.

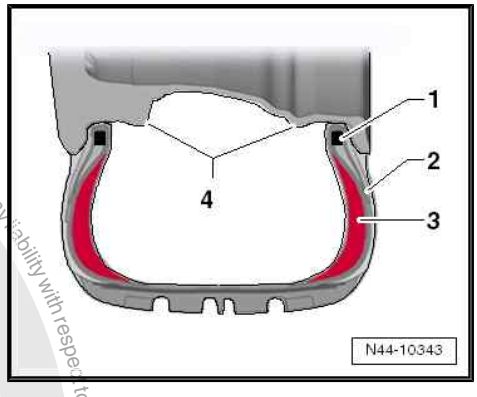
Body

1 - Beading with beading core

2 - Side wall

3 - Reinforced side wall

4 - Wheel rim with extended hump (EH2) on both sides - prerequisite when using tyres with run-flat properties



10.3 Retrofitting/requirements when using run-flat tyres

Caution

Retrofitting run-flat tyres to VW models may only be undertaken if the tyres are fitted as standard or they are available as an option.

These tyres may only be used on vehicles with a tyre pressure monitoring system as a pressure lose in the tyres is not always visible. This system warns the driver when an inflation pressure is less than a certain inflation pressure.

Permitted are:

Direct measuring systems ⇒ Running gear, axles, steering; Rep. gr. 44 ; Tyre pressure monitor

Indirect measuring systems ⇒ Running gear, axles, steering; Rep. gr. 44 ; Tyre pressure monitor

Tyres with run-flat properties may only be fitted on disc-type wheels with raised double hump (Extended Hump - EH2) ⇒ page 59 .

The special fitting/removal instructions must be observed ⇒ Running gear, axles, steering; Rep. gr. 44 ; Fitting and removing tyres with run-flat properties .

A mixed installation with standard tyres is not permitted, even on same axle.

Only in exceptional circumstances may a standard tyre be fitted e.g. for a short period or a limited distance. The special run-flat characteristics are lost, the driver must always be informed.

Please observe the recommended tyre manufacture
⇒ page 636 and ⇒ page 676 .

10.4 Repairs

WARNING

- *Tyres with run-flat properties must be replaced after they have been run deflated.*
- *The special fitting/removal instructions must be observed ⇒ Running gear, axles, steering; Rep. gr. 44 ; Fitting and removing tyres with run-flat properties .*

General information

- As with standard tyre/wheel systems, the disc-type wheel must also be checked before fitting.
- The disc-type wheel must be checked (for true running, runout and other damage) after a tyre has been run deflated ⇒ page 38 , as a pot-hole etc. could cause damage the disc-type wheel rim.
- Damaged disc-type wheels must be renewed.

11 Rolling resistance optimised tyres

The energy loss caused by the deformation of the tyre when rolling is known as rolling resistance.

With rolling resistance optimised tyres the deformation is greatly reduced by a revised design and the use of optimised tread compositions.

Volkswagen BlueMotion and BlueMotion technology models are fitted with tyres with an optimised rolling resistance and all other safety and customer relevant properties are of the latest level of development.

The respective approved makes of tyres are listed in the following chapters ⇒ page 636 .

12.4 Split rim composite wheels

Split rim alloy wheels consist of several parts.

The major parts are the rim and the wheel centre. These parts are bolted together with special bolts using a special process. This ensures that the wheel functions properly, that it is sealed and safe and that it runs true. These requirements are not guaranteed with workshop materials and under workshop conditions.

WARNING

You must not dismantle or repair composite wheels!

12.5 Alloy wheels with exchangeable trim elements

These wheels are fitted with exchangeable trim elements. Follow these instructions during installation.

– Push trim element -2- forcefully into alloy wheel -1-.
– Secure trim element -2- on inner side of alloy wheel -3- with clamping washers.

Minimum curing period: 3 hours at a minimum room temperature of 15°C.

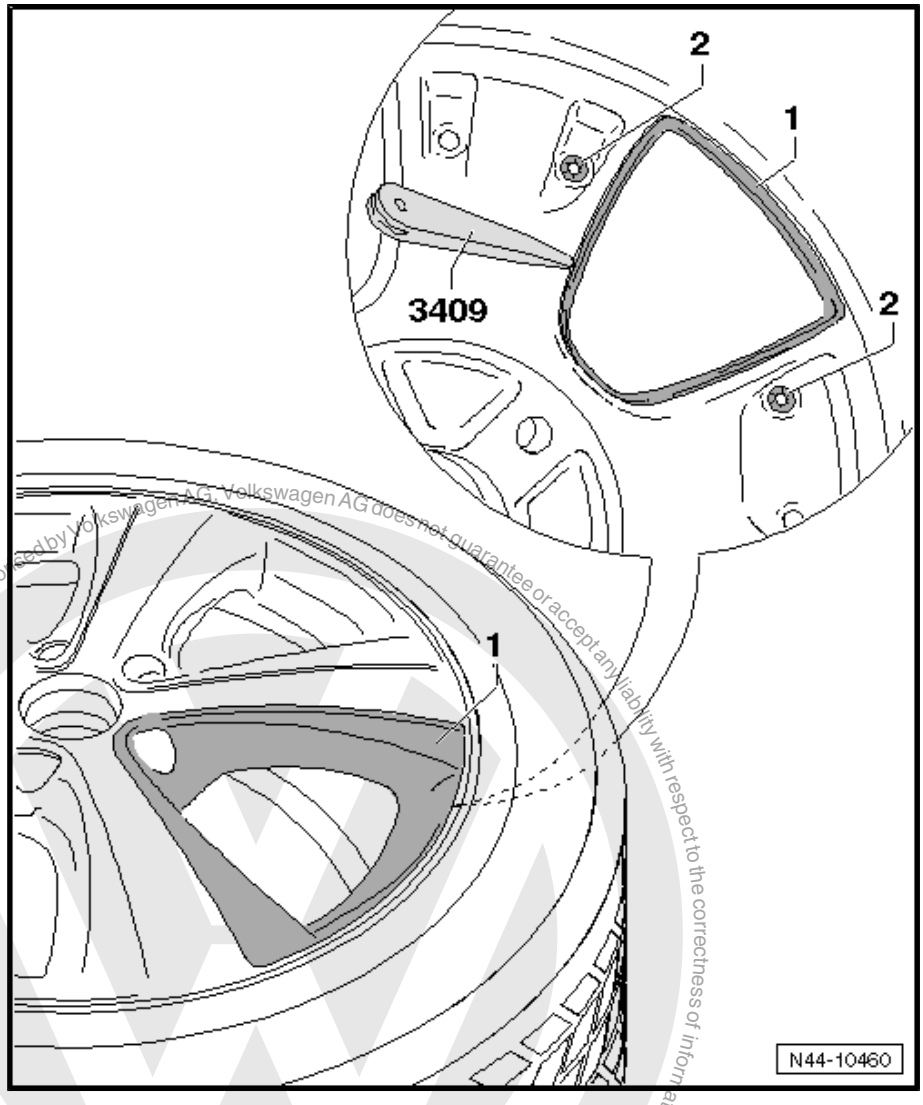
12.6.4 Removing trim element

Note

The trim element cannot be removed without causing damage to the element.



– Remove clamping washers -2- on inner side of alloy wheel.

– Heat outer side of trim element -1- with hot air blower - V.A.G 1416- .

Caution

Use only low heat on tyres and alloy wheels (do not overheat).

– Release trim element -1- on inner side of alloy wheel using wedge - 3409- .

– Grasp under a corner on the outside and pull trim element -1- forcefully off alloy wheel.

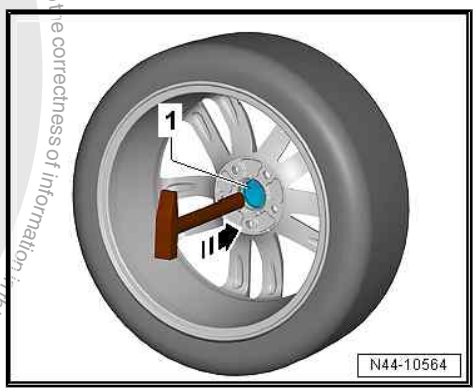
12.7 Hub cover for alloy wheels with open threaded connections

Removing

- Wheel removed

Note

Hold cover cap -1- when driving out with hammer.



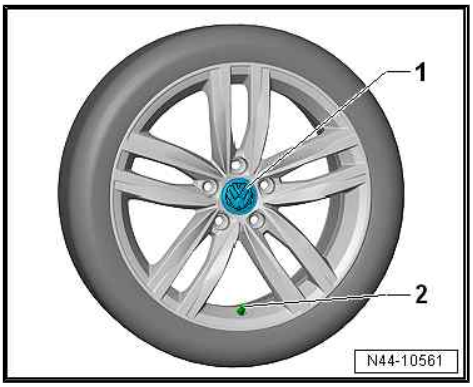
Installing

– Hold cover cap -1- flush against opening in alloy wheel rim.

– Align the Volkswagen emblem on the cover cap to the tyre inflation valve so that the emblem seats centrally over the valve -2-.

– Apply light hand pressure until the cover cap is pushed into the opening of the alloy wheel rim and is secure.

– Check cover cap has no play and that it is seated correctly in the alloy wheel rim.



12.8 Care and maintenance of alloy wheel rims

Regular care is required to maintain the decorative appearance of alloy wheels over a long period of time.

In particular road salt and dust from brake abrasion must be thoroughly washed off every 2 weeks; otherwise the finish of the alloy wheel will suffer.

Cleaning agents

Suitable cleaning agents:

- Plain water or water with soft soap
- Water and essence of vinegar
- Alloy wheel cleansers without acids or strong solvents

Do not exceed the soaking time of the cleaning agent.

The shorter the recommended soaking time, the harsher and more aggressive the cleaning agent.

Damage to finish

If the finish is damaged, for example by stones, the damage must be repaired as quickly as possible ⇒ page 66 .

Removing adhesive residue from glued balance weights on alloy rims

- Strong solvents and acids attack the finish on alloy wheels and the surface of the wheel becomes matt and milky. Therefore, these substances should not be used.
- To remove adhesive residue on alloy wheels, use alloy cleansers or a petrol-based cleanser. Do not exceed the soaking time of the cleaning agent.
- After cleaning or removing adhesive residue from wheels, rinse them with water.

12.9 Restoring alloy wheels

WARNING

- *Repairing a damaged wheel using heat treatment such as welding or the addition or removal of material is absolutely forbidden.*
- *Damaged or deformed wheel rims or wheel rims with cracked or deformed wheel bolt holes may not be repaired.*
- *Restoration may only be undertaken using approved and genuine paint materials.*
- *The manufactures guarantee no longer applies once a wheel rim has been restored.*

Wheel rims with cracks along the edges may not be repaired and must be replaced immediately.

Remachining, heat treatment and welding of all types is not permitted.

Material reforming is not permissible.

Before restoring, the radial runout and lateral runout must not exceed the manufactures tolerance of 0.8 mm.

Only cast alloy wheel rims may be filled using a filler putty. These wheels have the material identification AlSi xx stamped in the inner side.

Forged wheels may not be painted.

The restoration is limited to the painted surfaces.

Bright machined wheels, which only have a clear coating, may not be repaired.

Only surface damage on the viewed side (design surface) of the wheel may be restored.

Restoring a damaged surface depth of 1 mm must not be exceeded.

Only up to 50 mm may be removed/ filler filled on the outer boss.

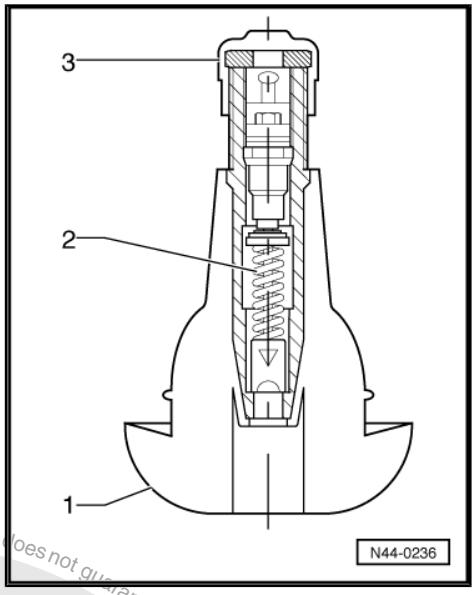
12.10 The valve



1 - Valve body

2 - Valve core

3 - Valve cap

1. Valve body

The rubber valve for tubeless tyres is designed to create an air-tight seal in the hole in the rim. The elastic material of the rubber valve body presses tightly into the hole in the rim.

In the case of valves with a threaded metal base, a rubber seal is used to seal the rim. The lateral faces of the rim hole are sealing surfaces. They must therefore be free of rust and dirt and must not be damaged.

2. Valve core

The valve insert has the most important job in the valve. It creates a seal and enables the regulation of the air pressure. The small flat seal on the valve core can only function correctly if it is free of foreign particles, dirt and moisture. The compressed air system must be free of water and oil!

3. Valve cap

A valve cap must always be screwed onto the valve. It prevents dirt from getting into the valve. Dirt which may be in the valve would reach the seal of the valve plate when the tyre is inflated and cause a leak.

The valve must be renewed every time a new tyre is fitted.

If the vehicle is driven without caps on the valves, there is the danger that dirt may get into the valve. This leads to a gradual loss of air, which in turn can lead to the destruction of the tyre.

- Separation of carcass and rubber ⇒ page 51
- Wide, circumferential furrows near the bead ⇒ page 51
- Stripped tread or stripped protector ⇒ page 51

WARNING

The valve cap must be fitted tightly to ensure air-tight sealing.

13 Fitting and removing wheels

13.1 Rotating wheels

Vehicles with front-wheel drive exhibit more tread wear on the front wheels due to the greater forces they have to transmit.

In order for all 4 wheels on the vehicle to have the same service life, we recommend rotating the front and rear wheels and tyres.

Ensure that uni-directional tyres are not reversed.

The longer the tyre runs at one position, the more it wears at certain points. Therefore it is recommended to rotate the wheels at short intervals, for example every 5,000 km.

Diagonal rotation is possible only with non-directional tyres. This method of wheel rotation is especially advantageous in the case of saw-tooth wear ⇒ page 30 .

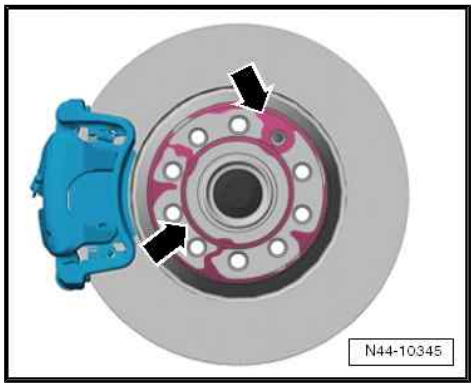
If saw-tooth wear has already progressed and the tread is worn to more than 50%, only slight improvements would be achieved and rotation is not recommended. The elasticity of the tread blocks declines and the saw-tooth wear does not progress.

13.2 Instructions for changing or fitting wheels

WARNING

Perform the checks and follow the instructions listed below. This is important to ensure that the wheel bolts and the wheels are properly secured.

– Check to ensure that contact surfaces -arrows- on brake disc are free of corrosion and dirt.



– Check to ensure that contact surface -arrow- on centring seat of brake disc are free of corrosion and dirt.

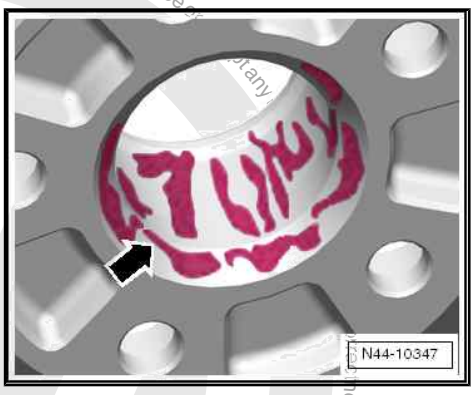
satelettronica

– Check to ensure that contact surface -arrow- on inner side of wheel (rim) and also centring seat of rim are free of corrosion and dirt.

– The concave seats * in the holes for the wheel bolts and the threads of the wheel bolts must also be free of corrosion and dirt, oil or grease.

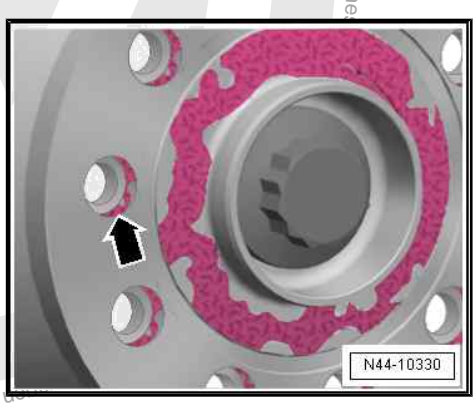
* The concave seat is the curved surface of a section of a sphere cut by a plane.



– Check whether the wheel bolts can be easily screwed in by hand. The thread of the wheel bolts must not come into contact with the bore in the brake disc -arrow-.

If the thread of the wheel bolt touches the hole -arrow-, turn the brake disc relative to the wheel hub accordingly.

Remove dirt and corrosion, oil or grease from the contact surfaces, threads in the wheel hub and/or wheel bolts as necessary.



> ⚠ WARNING
>
> *Damaged, badly corroded or difficult to remove wheel bolts must be renewed.*

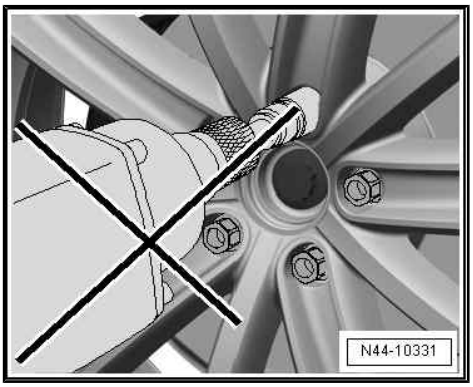
Fitting wheels

– Preserve wheel centring seat ⇒ Running gear, axles, steering; Rep. gr. 44 ; Protecting wheel centring seat against corrosion .

1 - When fitting the wheel, screw in all wheel bolts uniformly by hand.

2 - Tighten the wheel bolts in diagonal sequence to approx. 30 Nm.

3 - Lower vehicle to the floor and tighten all wheel bolts diagonally to the specified torque using the torque wrench ⇒ Running gear, axles, steering; Rep. gr. 44 ; Specified torque for wheel bolts .



> ⚠ WARNING
>
> *Do not use an impact driver when screwing in the bolts!*

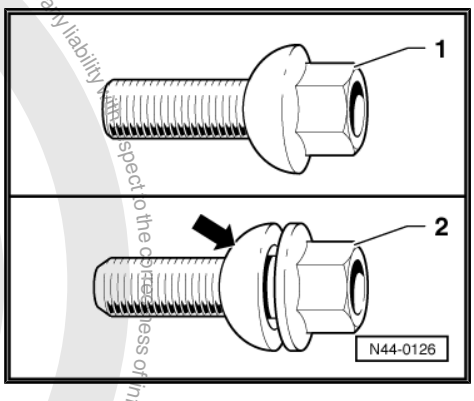
13.3 Revised wheel bolts for Sharan from model year 2001

Revised wheel bolts were used from model year 2001 and thereafter. These have the same dimensions and torque settings as the previous wheel bolts.



1 - For vehicles through model year 2000

Polished black surface - part no. -701 601 139 B- .

Not permitted on vehicles from model year 2001 or later.

2 - Wheel bolt for vehicles from model year 2001 and later

Collar -arrow- is not fixed in place on the hexagon.

Coated silver-coloured surface - part no. -7M3 601 139 B- .

Not permitted on vehicles to model year 2000.

> **WARNING**
>
> - *The modified wheel bolts are not permitted on vehicles produced to model year 2000.*
> - *Wheel rims from vehicles produced to model year 2000 are not permitted on vehicles from model year 2001 or later.*

13.4 Notes on use of temporary spare wheels

Inform your customers about the following notes and, if appropriate, refer also to the user's manual of the vehicle as the need arises.

The following notes also apply to spare wheels, e.g. 7 J x 16 with 205/55 R 16 tyres, marked with a yellow sticker with the text “MAX 80 km/h” or “MAX 50 mph”

Protected by copyright. Copyright by Volkswagen AG.
Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document.
satelettronica

Note

- *Depending on vehicle equipment, e.g. Passat cars with alloy wheels and 225 mm tyres have a spare wheel with the sticker described above instead of a temporary spare wheel.*
- *The spare wheel or temporary spare wheel is intended only for temporary use over short distances. Therefore, it must be replaces by a normal wheel as quickly as possible.*
- *After the temporary or spare wheel has been fitted, the tyre pressure must be checked as soon as possible. For the correct tyre pressure, please refer to the tyre pressure in the relevant vehicle or the relevant manual: Maintenance manual.*
- *Always observe the speed warning on the temporary spare wheel ("MAX 80 km/h" or "MAX 50 mph").*
- *Full acceleration, hard braking and driving fast through curves should be avoided.*
- *Never drive with more than one spare wheel or temporary spare wheel.*
- *The use of snow chains on the temporary spare wheel is not permitted for technical reasons.*
- *If it is necessary to travel with snow chains, the temporary spare wheel must be fitted on the rear axle even if the front tyre has been damaged. The now available rear wheel must then be fitted in place of the defective front wheel.*

14 Lupo 3L, Lupo FSI, Lupo GTI from model year 1999

General

Volkswagen vehicles are built according to the latest findings in safety engineering. To keep it that way, we recommend the use of only genuine Volkswagen spare parts. You can recognise this by the VW Audi logo and by the part number. It has been established that these parts are reliable, safe and suitable.

Despite constant appraisal of the market, we cannot assess other products on these points, even when in isolated cases they have been passed by official inspectors or have been granted official approval. Therefore, we cannot, of course, assume any liability if these products are installed.

16 Fox from model year 2005

General

Volkswagen vehicles are built according to the latest findings in safety engineering. To keep it that way, we recommend the use of only genuine Volkswagen spare parts. You can recognise this by the VW Audi logo and by the part number. It has been established that these parts are reliable, safe and suitable.

Despite constant appraisal of the market, we cannot assess other products on these points, even when in isolated cases they have been passed by official inspectors or have been granted official approval. Therefore, we cannot, of course, assume any liability if these products are installed.

WARNING

The products from Volkswagen genuine parts and Volkswagen genuine accessories may differ in fitting requirements, torque specifications and so on.

Always follow the respective fitting and operating instructions.

The wheel and tyre combinations or changes listed in the vehicle tables refer exclusively to Volkswagen Genuine wheels. Approval of wheel and tyre combinations or a change to wheels from the accessories trade is not possible with the parts certificate attached here.

WARNING

The fitting instructions and torque specifications for wheels from Volkswagen genuine accessories may differ from those intended for wheels from Volkswagen genuine parts.

Therefore, always observe the torque settings for the wheel bolts as well as the respective fitting and operating instructions.

16.1 Fox, type 5Z model year 2005 to model year 2012

Appendix for certificate statement 8107901084

The parts certificate can be found on the Volkswagen ServiceNet under Accessories/Tyres, Wheels and Tyres, Wheels and Tyres Guide.

18 Polo Classic model year 1996 to model year 2002

General

Volkswagen vehicles are built according to the latest findings in safety engineering. To keep it that way, we recommend the use of only genuine Volkswagen spare parts. You can recognise this by the VW Audi logo and by the part number. It has been established that these parts are reliable, safe and suitable.

Despite constant appraisal of the market, we cannot assess other products on these points, even when in isolated cases they have been passed by official inspectors or have been granted official approval. Therefore, we cannot, of course, assume any liability if these products are installed.

> ⚠ **WARNING**
>
> *The products from Volkswagen genuine parts and Votex genuine accessories may differ in fitting requirements, torque specifications and so on.*
>
> *Always follow the respective fitting and operating instructions.*

The wheel and tyre combinations or changes listed in the vehicle tables refer exclusively to Volkswagen Genuine wheels. Approval of wheel and tyre combinations or a change to wheels from the accessories trade is not possible with the parts certificate attached here.

> ⚠ **WARNING**
>
> *The fitting instructions and torque specifications for wheels from Votex genuine accessories may differ from those intended for wheels from Volkswagen genuine parts.*
>
> *Therefore, always observe the torque settings for the wheel bolts as well as the respective fitting and operating instructions.*

19 Polo Variant model year 1998 to model year 2002

General

Volkswagen vehicles are built according to the latest findings in safety engineering. To keep it that way, we recommend the use of only genuine Volkswagen spare parts. You can recognise this by the VW Audi logo and by the part number. It has been established that these parts are reliable, safe and suitable.

Despite constant appraisal of the market, we cannot assess other products on these points, even when in isolated cases they have been passed by official inspectors or have been granted official approval. Therefore, we cannot, of course, assume any liability if these products are installed.

> ⚠ **WARNING**
>
> *The products from Volkswagen genuine parts and Votex genuine accessories may differ in fitting requirements, torque specifications and so on.*
>
> *Always follow the respective fitting and operating instructions.*

The wheel and tyre combinations or changes listed in the vehicle tables refer exclusively to Volkswagen Genuine wheels. Approval of wheel and tyre combinations or a change to wheels from the accessories trade is not possible with the parts certificate attached here.

> ⚠ **WARNING**
>
> *The fitting instructions and torque specifications for wheels from Votex genuine accessories may differ from those intended for wheels from Volkswagen genuine parts.*
>
> *Therefore, always observe the torque settings for the wheel bolts as well as the respective fitting and operating instructions.*

21 Polo Fun model year 2004 to model year 2005

General

Volkswagen vehicles are built according to the latest findings in safety engineering. To keep it that way, we recommend the use of only genuine Volkswagen spare parts. You can recognise this by the VW Audi logo and by the part number. It has been established that these parts are reliable, safe and suitable.

Despite constant appraisal of the market, we cannot assess other products on these points, even when in isolated cases they have been passed by official inspectors or have been granted official approval. Therefore, we cannot, of course, assume any liability if these products are installed.

> ⚠ **WARNING**
>
> *The products from Volkswagen genuine parts and Votex genuine accessories may differ in fitting requirements, torque specifications and so on.*
>
> *Always follow the respective fitting and operating instructions.*

The wheel and tyre combinations or changes listed in the vehicle tables refer exclusively to Volkswagen Genuine wheels. Approval of wheel and tyre combinations or a change to wheels from the accessories trade is not possible with the parts certificate attached here.

> ⚠ **WARNING**
>
> *The fitting instructions and torque specifications for wheels from Votex genuine accessories may differ from those intended for wheels from Volkswagen genuine parts.*
>
> *Therefore, always observe the torque settings for the wheel bolts as well as the respective fitting and operating instructions.*

25 Polo GTI Cup Edition from model year 2007

General

Volkswagen vehicles are built according to the latest findings in safety engineering. To keep it that way, we recommend the use of only genuine Volkswagen spare parts. You can recognise this by the VW Audi logo and by the part number. It has been established that these parts are reliable, safe and suitable.

Despite constant appraisal of the market, we cannot assess other products on these points, even when in isolated cases they have been passed by official inspectors or have been granted official approval. Therefore, we cannot, of course, assume any liability if these products are installed.

WARNING

The products from Volkswagen genuine parts and Votex genuine accessories may differ in fitting requirements, torque specifications and so on.

Always follow the respective fitting and operating instructions.

The wheel and tyre combinations or changes listed in the vehicle tables refer exclusively to Volkswagen Genuine wheels. Approval of wheel and tyre combinations or a change to wheels from the accessories trade is not possible with the parts certificate attached here.

WARNING

The fitting instructions and torque specifications for wheels from Votex genuine accessories may differ from those intended for wheels from Volkswagen genuine parts.

Therefore, always observe the torque settings for the wheel bolts as well as the respective fitting and operating instructions.

25.1 Polo GTI Cup Edition, type 9N model year 2007 to model year 2009

Appendix for parts certificate 3879/08

The parts certificate can be found on the Volkswagen ServiceNet under Technology; Guides; Wheels and Tyres Guide.

28 Golf model year 1998 to model year 2004, Golf R32, Golf Anniversary GTI

General

Volkswagen vehicles are built according to the latest findings in safety engineering. To keep it that way, we recommend the use of only genuine Volkswagen spare parts. You can recognise this by the VW Audi logo and by the part number. It has been established that these parts are reliable, safe and suitable.

Despite constant appraisal of the market, we cannot assess other products on these points, even when in isolated cases they have been passed by official inspectors or have been granted official approval. Therefore, we cannot, of course, assume any liability if these products are installed.

> ⚠ **WARNING**
>
> *The products from Volkswagen genuine parts and Votex genuine accessories may differ in fitting requirements, torque specifications and so on.*
>
> *Always follow the respective fitting and operating instructions.*

The wheel and tyre combinations or changes listed in the vehicle tables refer exclusively to Volkswagen Genuine wheels. Approval of wheel and tyre combinations or a change to wheels from the accessories trade is not possible with the parts certificate attached here.

> ⚠ **WARNING**
>
> *The fitting instructions and torque specifications for wheels from Votex genuine accessories may differ from those intended for wheels from Volkswagen genuine parts.*
>
> *Therefore, always observe the torque settings for the wheel bolts as well as the respective fitting and operating instructions.*

28.3 Conditions for fitting 17" wheels and tyres to Golf model year 1998 to model year 2004

17" wheels with 225/45 R 17 tyres are possible only:

1. For vehicles from model year 2001.

2. If 17" sports running gear and a steering box with reduced steering arm travel is installed in the vehicle

Allocation of steering box PR No. to engine:	
PR No. of steering box	**Engine**
QZ 3[5)]	1.8l; 2.0l; 2.3l petrol engines; 1.9l diesel engines
QZ 4[5)]	Up to and including 1.6l petrol engines
QZ 5[5)]	VR6 (US version); VR6 4Motion

5) Replacement part numbers ⇒ Electronic parts catalogue “ETKA”

3. If tyres with a maximum width of 218 mm are used.

4. If snow chains are not used.

Maximum width of 17" tyres

If a vehicle is retrofitted with 17" tyres or if existing 17" tyres are renewed, use only tyres with a maximum width -a- which does not exceed 218 mm during use [6)].

6) The measured width of the tyre including lettering on 7 J x 17 or $7^1/_2$ J x 17 and at the specified tyre pressure.

If wider tyres are used, under certain circumstances, the tyres may contact the front axle and the bodywork while the car is being driven.

28.8 Conditions for fitting 17" and 18" wheels and tyres of Golf Anniversary GTI

Conditions for fitting 17" wheels and tyres

17" wheels with 225/45 R 17 tyres are possible only:

1. For vehicles from model year 2001.

2. If a steering box with reduced steering arm travel for vehicles with 17" sports running gear is installed.

PR No. of steering box:	QZ 3[7)]

7) Replacement part numbers ⇒ Electronic parts catalogue "ETKA"

3. If tyres with a maximum width of 218 mm are used.

4. If snow chains are not used.

Conditions for fitting 18" wheels and tyres

These vehicles are equipped as standard with a steering gear having reduced steering arm travel and sports running gear. These components cannot be retrofitted on vehicles which were not originally equipped with them.

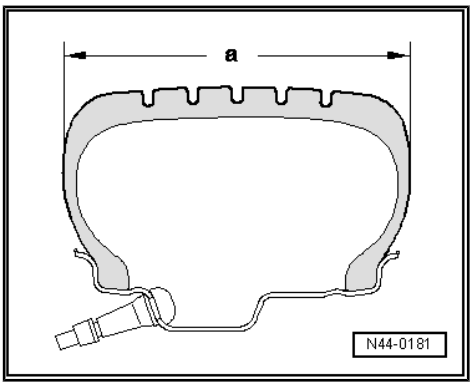
Maximum width for 17" and 18" tyres

If a vehicle is retrofitted with 17" or 18" tyres or if existing 17" or 18" tyres are renewed, use only tyres which do not exceed the maximum width -a- during use [8)].

Dimension -a- for 17" tyres: 218 mm

Dimension -a- for 18" tyres: 225 mm

8) 1) The measured width of the tyre including lettering fitted on an appropriate wheel at the specified pressure.



If wider tyres are used, under certain circumstances, the tyres may contact the front axle and the bodywork while the car is being driven.

29 Golf model year 2004 to model year 2009

General

Volkswagen vehicles are built according to the latest findings in safety engineering. To keep it that way, we recommend the use of only genuine Volkswagen spare parts. You can recognise this by the VW Audi logo and by the part number. It has been established that these parts are reliable, safe and suitable.

Despite constant appraisal of the market, we cannot assess other products on these points, even when in isolated cases they have been passed by official inspectors or have been granted official approval. Therefore, we cannot, of course, assume any liability if these products are installed.

> ⚠ **WARNING**
>
> *The products from Volkswagen genuine parts and Votex genuine accessories may differ in fitting requirements, torque specifications and so on.*
>
> *Always follow the respective fitting and operating instructions.*

The wheel and tyre combinations or changes listed in the vehicle tables refer exclusively to Volkswagen Genuine wheels. Approval of wheel and tyre combinations or a change to wheels from the accessories trade is not possible with the parts certificate attached here.

> ⚠ **WARNING**
>
> *The fitting instructions and torque specifications for wheels from Votex genuine accessories may differ from those intended for wheels from Volkswagen genuine parts.*
>
> *Therefore, always observe the torque settings for the wheel bolts as well as the respective fitting and operating instructions.*

30 Golf BlueMotion model year 2008 to model year 2009

General

Volkswagen vehicles are built according to the latest findings in safety engineering. To keep it that way, we recommend the use of only genuine Volkswagen spare parts. You can recognise this by the VW Audi logo and by the part number. It has been established that these parts are reliable, safe and suitable.

Despite constant appraisal of the market, we cannot assess other products on these points, even when in isolated cases they have been passed by official inspectors or have been granted official approval. Therefore, we cannot, of course, assume any liability if these products are installed.

> ⚠ **WARNING**
>
> *The products from Volkswagen genuine parts and Votex genuine accessories may differ in fitting requirements, torque specifications and so on.*
>
> *Always follow the respective fitting and operating instructions.*

The wheel and tyre combinations or changes listed in the vehicle tables refer exclusively to Volkswagen Genuine wheels. Approval of wheel and tyre combinations or a change to wheels from the accessories trade is not possible with the parts certificate attached here.

> ⚠ **WARNING**
>
> *The fitting instructions and torque specifications for wheels from Votex genuine accessories may differ from those intended for wheels from Volkswagen genuine parts.*
>
> *Therefore, always observe the torque settings for the wheel bolts as well as the respective fitting and operating instructions.*

32 Pirelli Golf model year 2008 to model year 2009

General

Volkswagen vehicles are built according to the latest findings in safety engineering. To keep it that way, we recommend the use of only genuine Volkswagen spare parts. You can recognise this by the VW Audi logo and by the part number. It has been established that these parts are reliable, safe and suitable.

Despite constant appraisal of the market, we cannot assess other products on these points, even when in isolated cases they have been passed by official inspectors or have been granted official approval. Therefore, we cannot, of course, assume any liability if these products are installed.

WARNING

The products from Volkswagen genuine parts and Votex genuine accessories may differ in fitting requirements, torque specifications and so on.

Always follow the respective fitting and operating instructions.

The wheel and tyre combinations or changes listed in the vehicle tables refer exclusively to Volkswagen Genuine wheels. Approval of wheel and tyre combinations or a change to wheels from the accessories trade is not possible with the parts certificate attached here.

WARNING

The fitting instructions and torque specifications for wheels from Votex genuine accessories may differ from those intended for wheels from Volkswagen genuine parts.

Therefore, always observe the torque settings for the wheel bolts as well as the respective fitting and operating instructions.

32.1 Pirelli Golf, type 1K model year 2008 to model year 2009

Appendix for parts certificate 2066/08

The parts certificate can be found on the Volkswagen ServiceNet under Technology; Guides; Wheels and Tyres Guide.

33 Golf R32 model year 2006 to model year 2009

General

Volkswagen vehicles are built according to the latest findings in safety engineering. To keep it that way, we recommend the use of only genuine Volkswagen spare parts. You can recognise this by the VW Audi logo and by the part number. It has been established that these parts are reliable, safe and suitable.

Despite constant appraisal of the market, we cannot assess other products on these points, even when in isolated cases they have been passed by official inspectors or have been granted official approval. Therefore, we cannot, of course, assume any liability if these products are installed.

> ⚠ **WARNING**
>
> *The products from Volkswagen genuine parts and Votex genuine accessories may differ in fitting requirements, torque specifications and so on.*
>
> *Always follow the respective fitting and operating instructions.*

The wheel and tyre combinations or changes listed in the vehicle tables refer exclusively to Volkswagen Genuine wheels. Approval of wheel and tyre combinations or a change to wheels from the accessories trade is not possible with the parts certificate attached here.

> ⚠ **WARNING**
>
> *The fitting instructions and torque specifications for wheels from Votex genuine accessories may differ from those intended for wheels from Volkswagen genuine parts.*
>
> *Therefore, always observe the torque settings for the wheel bolts as well as the respective fitting and operating instructions.*

35 Golf Plus from model year 2005

General

Volkswagen vehicles are built according to the latest findings in safety engineering. To keep it that way, we recommend the use of only genuine Volkswagen spare parts. You can recognise this by the VW Audi logo and by the part number. It has been established that these parts are reliable, safe and suitable.

Despite constant appraisal of the market, we cannot assess other products on these points, even when in isolated cases they have been passed by official inspectors or have been granted official approval. Therefore, we cannot, of course, assume any liability if these products are installed.

> ⚠ **WARNING**
>
> *The products from Volkswagen genuine parts and Votex genuine accessories may differ in fitting requirements, torque specifications and so on.*
>
> *Always follow the respective fitting and operating instructions.*

The wheel and tyre combinations or changes listed in the vehicle tables refer exclusively to Volkswagen Genuine wheels. Approval of wheel and tyre combinations or a change to wheels from the accessories trade is not possible with the parts certificate attached here.

> ⚠ **WARNING**
>
> *The fitting instructions and torque specifications for wheels from Votex genuine accessories may differ from those intended for wheels from Volkswagen genuine parts.*
>
> *Therefore, always observe the torque settings for the wheel bolts as well as the respective fitting and operating instructions.*

36 Golf Plus BlueMotion from model year 2008

General

Volkswagen vehicles are built according to the latest findings in safety engineering. To keep it that way, we recommend the use of only genuine Volkswagen spare parts. You can recognise this by the VW Audi logo and by the part number. It has been established that these parts are reliable, safe and suitable.

Despite constant appraisal of the market, we cannot assess other products on these points, even when in isolated cases they have been passed by official inspectors or have been granted official approval. Therefore, we cannot, of course, assume any liability if these products are installed.

> ⚠ **WARNING**
>
> *The products from Volkswagen genuine parts and Votex genuine accessories may differ in fitting requirements, torque specifications and so on.*
>
> *Always follow the respective fitting and operating instructions.*

The wheel and tyre combinations or changes listed in the vehicle tables refer exclusively to Volkswagen Genuine wheels. Approval of wheel and tyre combinations or a change to wheels from the accessories trade is not possible with the parts certificate attached here.

> ⚠ **WARNING**
>
> *The fitting instructions and torque specifications for wheels from Votex genuine accessories may differ from those intended for wheels from Volkswagen genuine parts.*
>
> *Therefore, always observe the torque settings for the wheel bolts as well as the respective fitting and operating instructions.*

38 Golf Variant model year 1999 to model year 2006, Bora Variant model year 1999 to model year 2005

General

Volkswagen vehicles are built according to the latest findings in safety engineering. To keep it that way, we recommend the use of only genuine Volkswagen spare parts. You can recognise this by the VW Audi logo and by the part number. It has been established that these parts are reliable, safe and suitable.

Despite constant appraisal of the market, we cannot assess other products on these points, even when in isolated cases they have been passed by official inspectors or have been granted official approval. Therefore, we cannot, of course, assume any liability if these products are installed.

WARNING

The products from Volkswagen genuine parts and Votex genuine accessories may differ in fitting requirements, torque specifications and so on.

Always follow the respective fitting and operating instructions.

The wheel and tyre combinations or changes listed in the vehicle tables refer exclusively to Volkswagen Genuine wheels. Approval of wheel and tyre combinations or a change to wheels from the accessories trade is not possible with the parts certificate attached here.

WARNING

The fitting instructions and torque specifications for wheels from Votex genuine accessories may differ from those intended for wheels from Volkswagen genuine parts.

Therefore, always observe the torque settings for the wheel bolts as well as the respective fitting and operating instructions.

3. If tyres with a maximum width of 218 mm are used:

4. If snow chains are not used.

Maximum width of 17" tyres

If a vehicle is retrofitted with 17" tyres or if existing 17" tyres are renewed, use only tyres with a maximum width -a- which does not exceed 218 mm during use [10)].

10) The measured width of the tyre including lettering on 7 J x 17 or $7^1/_2$ J x 17 and at the specified tyre pressure.

If wider tyres are used, under certain circumstances, the tyres may contact the front axle and the bodywork while the car is being driven.

39 Golf Variant model year 2007 to model year 2010

General

Volkswagen vehicles are built according to the latest findings in safety engineering. To keep it that way, we recommend the use of only genuine Volkswagen spare parts. You can recognise this by the VW Audi logo and by the part number. It has been established that these parts are reliable, safe and suitable.

Despite constant appraisal of the market, we cannot assess other products on these points, even when in isolated cases they have been passed by official inspectors or have been granted official approval. Therefore, we cannot, of course, assume any liability if these products are installed.

> ⚠ **WARNING**
>
> *The products from Volkswagen genuine parts and Votex genuine accessories may differ in fitting requirements, torque specifications and so on.*
>
> *Always follow the respective fitting and operating instructions.*

The wheel and tyre combinations or changes listed in the vehicle tables refer exclusively to Volkswagen Genuine wheels. Approval of wheel and tyre combinations or a change to wheels from the accessories trade is not possible with the parts certificate attached here.

> ⚠ **WARNING**
>
> *The fitting instructions and torque specifications for wheels from Votex genuine accessories may differ from those intended for wheels from Volkswagen genuine parts.*
>
> *Therefore, always observe the torque settings for the wheel bolts as well as the respective fitting and operating instructions.*

40 Golf Variant BlueMotion model year 2008 to model year 2010

General

Volkswagen vehicles are built according to the latest findings in safety engineering. To keep it that way, we recommend the use of only genuine Volkswagen spare parts. You can recognise this by the VW Audi logo and by the part number. It has been established that these parts are reliable, safe and suitable.

Despite constant appraisal of the market, we cannot assess other products on these points, even when in isolated cases they have been passed by official inspectors or have been granted official approval. Therefore, we cannot, of course, assume any liability if these products are installed.

> ⚠ **WARNING**
>
> *The products from Volkswagen genuine parts and Votex genuine accessories may differ in fitting requirements, torque specifications and so on.*
>
> *Always follow the respective fitting and operating instructions.*

The wheel and tyre combinations or changes listed in the vehicle tables refer exclusively to Volkswagen Genuine wheels. Approval of wheel and tyre combinations or a change to wheels from the accessories trade is not possible with the parts certificate attached here.

> ⚠ **WARNING**
>
> *The fitting instructions and torque specifications for wheels from Votex genuine accessories may differ from those intended for wheels from Volkswagen genuine parts.*
>
> *Therefore, always observe the torque settings for the wheel bolts as well as the respective fitting and operating instructions.*

42 Jetta BlueMotion from Model year 2008

General

Volkswagen vehicles are built according to the latest findings in safety engineering. To keep it that way, we recommend the use of only genuine Volkswagen spare parts. You can recognise this by the VW Audi logo and by the part number. It has been established that these parts are reliable, safe and suitable.

Despite constant appraisal of the market, we cannot assess other products on these points, even when in isolated cases they have been passed by official inspectors or have been granted official approval. Therefore, we cannot, of course, assume any liability if these products are installed.

> ⚠ **WARNING**
>
> *The products from Volkswagen genuine parts and Volkswagen genuine accessories may differ in fitting requirements, torque specifications and so on.*
>
> *Always follow the respective fitting and operating instructions.*

The wheel and tyre combinations or changes listed in the vehicle tables refer exclusively to Volkswagen Genuine wheels. Approval of wheel and tyre combinations or a change to wheels from the accessories trade is not possible with the certificate statement attached here.

> ⚠ **WARNING**
>
> *The fitting instructions and torque specifications for wheels from Volkswagen genuine accessories may differ from those intended for wheels from Volkswagen genuine parts.*
>
> *Therefore, always observe the torque settings for the wheel bolts as well as the respective fitting and operating instructions.*

44 Golf cabriolet model year 1998 to model year 2002

General

Volkswagen vehicles are built according to the latest findings in safety engineering. To keep it that way, we recommend the use of only genuine Volkswagen spare parts. You can recognise this by the VW Audi logo and by the part number. It has been established that these parts are reliable, safe and suitable.

Despite constant appraisal of the market, we cannot assess other products on these points, even when in isolated cases they have been passed by official inspectors or have been granted official approval. Therefore, we cannot, of course, assume any liability if these products are installed.

> ⚠ **WARNING**
>
> *The products from Volkswagen genuine parts and Votex genuine accessories may differ in fitting requirements, torque specifications and so on.*
>
> *Always follow the respective fitting and operating instructions.*

The wheel and tyre combinations or changes listed in the vehicle tables refer exclusively to Volkswagen Genuine wheels. Approval of wheel and tyre combinations or a change to wheels from the accessories trade is not possible with the parts certificate attached here.

> ⚠ **WARNING**
>
> *The fitting instructions and torque specifications for wheels from Votex genuine accessories may differ from those intended for wheels from Volkswagen genuine parts.*
>
> *Therefore, always observe the torque settings for the wheel bolts as well as the respective fitting and operating instructions.*

46 Bora model year 1999 to model year 2005

General

Volkswagen vehicles are built according to the latest findings in safety engineering. To keep it that way, we recommend the use of only genuine Volkswagen spare parts. You can recognise this by the VW Audi logo and by the part number. It has been established that these parts are reliable, safe and suitable.

Despite constant appraisal of the market, we cannot assess other products on these points, even when in isolated cases they have been passed by official inspectors or have been granted official approval. Therefore, we cannot, of course, assume any liability if these products are installed.

> ⚠ **WARNING**
>
> *The products from Volkswagen genuine parts and Votex genuine accessories may differ in fitting requirements, torque specifications and so on.*
>
> *Always follow the respective fitting and operating instructions.*

The wheel and tyre combinations or changes listed in the vehicle tables refer exclusively to Volkswagen Genuine wheels. Approval of wheel and tyre combinations or a change to wheels from the accessories trade is not possible with the parts certificate attached here.

> ⚠ **WARNING**
>
> *The fitting instructions and torque specifications for wheels from Votex genuine accessories may differ from those intended for wheels from Volkswagen genuine parts.*
>
> *Therefore, always observe the torque settings for the wheel bolts as well as the respective fitting and operating instructions.*

46.3 Conditions for fitting 17" wheels and tyres

17" wheels with 225/45 R 17 tyres are possible only:

1. For vehicles from model year 2001.

2. If 17" sports running gear and a steering box with reduced steering arm travel is installed in the vehicle

Allocation of steering box PR No. to engine:	
PR No. of steering box	**Engine**

QZ 4[11)]	Up to and including 1.6l petrol engines
QZ 5[11)]	VR6 (US version); VR6 4Motion

11) Replacement part numbers ⇒ Electronic parts catalogue "ETKA"

3. If tyres with a maximum width of 218 mm are used.

4. If snow chains are not used.

Maximum width of 17" tyres

If a vehicle is retrofitted with 17" tyres or if existing 17" tyres are renewed, use only tyres with a maximum width -a- which does not exceed 218 mm during use [12)].

12) The measured width of the tyre including lettering on 7 J x 17 or $7^1/_2$ J x 17 and at the specified tyre pressure.

If wider tyres are used, under certain circumstances, the tyres may contact the front axle and the bodywork while the car is being driven.

47 New Beetle from model year 1999

General

Volkswagen vehicles are built according to the latest findings in safety engineering. To keep it that way, we recommend the use of only genuine Volkswagen spare parts. You can recognise this by the VW Audi logo and by the part number. It has been established that these parts are reliable, safe and suitable.

Despite constant appraisal of the market, we cannot assess other products on these points, even when in isolated cases they have been passed by official inspectors or have been granted official approval. Therefore, we cannot, of course, assume any liability if these products are installed.

> ⚠ **WARNING**
>
> *The products from Volkswagen genuine parts and Volkswagen genuine accessories may differ in fitting requirements, torque specifications and so on.*
>
> *Always follow the respective fitting and operating instructions.*

The wheel and tyre combinations or changes listed in the vehicle tables refer exclusively to Volkswagen Genuine wheels. Approval of wheel and tyre combinations or a change to wheels from the accessories trade is not possible with the parts certificate attached here.

> ⚠ **WARNING**
>
> *The fitting instructions and torque specifications for wheels from Volkswagen genuine accessories may differ from those intended for wheels from Volkswagen genuine parts.*
>
> *Therefore, always observe the torque settings for the wheel bolts as well as the respective fitting and operating instructions.*

48 New Beetle Cabriolet from model year 2003

General

Volkswagen vehicles are built according to the latest findings in safety engineering. To keep it that way, we recommend the use of only genuine Volkswagen spare parts. You can recognise this by the VW Audi logo and by the part number. It has been established that these parts are reliable, safe and suitable.

Despite constant appraisal of the market, we cannot assess other products on these points, even when in isolated cases they have been passed by official inspectors or have been granted official approval. Therefore, we cannot, of course, assume any liability if these products are installed.

> ⚠ **WARNING**
>
> *The products from Volkswagen genuine parts and Volkswagen genuine accessories may differ in fitting requirements, torque specifications and so on.*
>
> *Always follow the respective fitting and operating instructions.*

The wheel and tyre combinations or changes listed in the vehicle tables refer exclusively to Volkswagen Genuine wheels. Approval of wheel and tyre combinations or a change to wheels from the accessories trade is not possible with the parts certificate attached here.

> ⚠ **WARNING**
>
> *The fitting instructions and torque specifications for wheels from Volkswagen genuine accessories may differ from those intended for wheels from Volkswagen genuine parts.*
>
> *Therefore, always observe the torque settings for the wheel bolts as well as the respective fitting and operating instructions.*

49 New Beetle RSi

General

Volkswagen vehicles are built according to the latest findings in safety engineering. To keep it that way, we recommend the use of only genuine Volkswagen spare parts. You can recognise this by the VW Audi logo and by the part number. It has been established that these parts are reliable, safe and suitable.

Despite constant appraisal of the market, we cannot assess other products on these points, even when in isolated cases they have been passed by official inspectors or have been granted official approval. Therefore, we cannot, of course, assume any liability if these products are installed.

> **WARNING**
>
> *The products from Volkswagen genuine parts and Votex genuine accessories may differ in fitting requirements, torque specifications and so on.*
>
> *Always follow the respective fitting and operating instructions.*

The wheel and tyre combinations or changes listed in the vehicle tables refer exclusively to Volkswagen Genuine wheels. Approval of wheel and tyre combinations or a change to wheels from the accessories trade is not possible with the parts certificate attached here.

> **WARNING**
>
> *The fitting instructions and torque specifications for wheels from Votex genuine accessories may differ from those intended for wheels from Volkswagen genuine parts.*
>
> *Therefore, always observe the torque settings for the wheel bolts as well as the respective fitting and operating instructions.*

51 Passat model year 1997 to model year 2005

General

Volkswagen vehicles are built according to the latest findings in safety engineering. To keep it that way, we recommend the use of only genuine Volkswagen spare parts. You can recognise this by the VW Audi logo and by the part number. It has been established that these parts are reliable, safe and suitable.

Despite constant appraisal of the market, we cannot assess other products on these points, even when in isolated cases they have been passed by official inspectors or have been granted official approval. Therefore, we cannot, of course, assume any liability if these products are installed.

> ⚠ **WARNING**
>
> *The products from Volkswagen genuine parts and Votex genuine accessories may differ in fitting requirements, torque specifications and so on.*
>
> *Always follow the respective fitting and operating instructions.*

The wheel and tyre combinations or changes listed in the vehicle tables refer exclusively to Volkswagen Genuine wheels. Approval of wheel and tyre combinations or a change to wheels from the accessories trade is not possible with the parts certificate attached here.

> ⚠ **WARNING**
>
> *The fitting instructions and torque specifications for wheels from Votex genuine accessories may differ from those intended for wheels from Volkswagen genuine parts.*
>
> *Therefore, always observe the torque settings for the wheel bolts as well as the respective fitting and operating instructions.*

52 Passat saloon from model year 2006

General

Volkswagen vehicles are built according to the latest findings in safety engineering. To keep it that way, we recommend the use of only genuine Volkswagen spare parts. You can recognise this by the VW Audi logo and by the part number. It has been established that these parts are reliable, safe and suitable.

Despite constant appraisal of the market, we cannot assess other products on these points, even when in isolated cases they have been passed by official inspectors or have been granted official approval. Therefore, we cannot, of course, assume any liability if these products are installed.

> ⚠ **WARNING**
>
> *The products from Volkswagen genuine parts and Votex genuine accessories may differ in fitting requirements, torque specifications and so on.*
>
> *Always follow the respective fitting and operating instructions.*

The wheel and tyre combinations or changes listed in the vehicle tables refer exclusively to Volkswagen Genuine wheels. Approval of wheel and tyre combinations or a change to wheels from the accessories trade is not possible with the certificate statement attached here.

> ⚠ **WARNING**
>
> *The fitting instructions and torque specifications for wheels from Votex genuine accessories may differ from those intended for wheels from Volkswagen genuine parts.*
>
> *Therefore, always observe the torque settings for the wheel bolts as well as the respective fitting and operating instructions.*

53 Passat saloon BlueMotion from model year 2008

General

Volkswagen vehicles are built according to the latest findings in safety engineering. To keep it that way, we recommend the use of only genuine Volkswagen spare parts. You can recognise this by the VW Audi logo and by the part number. It has been established that these parts are reliable, safe and suitable.

Despite constant appraisal of the market, we cannot assess other products on these points, even when in isolated cases they have been passed by official inspectors or have been granted official approval. Therefore, we cannot, of course, assume any liability if these products are installed.

> ⚠ **WARNING**
>
> *The products from Volkswagen genuine parts and Votex genuine accessories may differ in fitting requirements, torque specifications and so on.*
>
> *Always follow the respective fitting and operating instructions.*

The wheel and tyre combinations or changes listed in the vehicle tables refer exclusively to Volkswagen Genuine wheels. Approval of wheel and tyre combinations or a change to wheels from the accessories trade is not possible with the certificate statement attached here.

> ⚠ **WARNING**
>
> *The fitting instructions and torque specifications for wheels from Votex genuine accessories may differ from those intended for wheels from Volkswagen genuine parts.*
>
> *Therefore, always observe the torque settings for the wheel bolts as well as the respective fitting and operating instructions.*

54 Passat Variant from model year 2006

General

Volkswagen vehicles are built according to the latest findings in safety engineering. To keep it that way, we recommend the use of only genuine Volkswagen spare parts. You can recognise this by the VW Audi logo and by the part number. It has been established that these parts are reliable, safe and suitable.

Despite constant appraisal of the market, we cannot assess other products on these points, even when in isolated cases they have been passed by official inspectors or have been granted official approval. Therefore, we cannot, of course, assume any liability if these products are installed.

WARNING

The products from Volkswagen genuine parts and Votex genuine accessories may differ in fitting requirements, torque specifications and so on.

Always follow the respective fitting and operating instructions.

The wheel and tyre combinations or changes listed in the vehicle tables refer exclusively to Volkswagen Genuine wheels. Approval of wheel and tyre combinations or a change to wheels from the accessories trade is not possible with the certificate statement attached here.

WARNING

The fitting instructions and torque specifications for wheels from Votex genuine accessories may differ from those intended for wheels from Volkswagen genuine parts.

Therefore, always observe the torque settings for the wheel bolts as well as the respective fitting and operating instructions.

54.1 Passat Variant, type 3C model year 2006

55 Passat Variant BlueMotion from model year 2008

General

Volkswagen vehicles are built according to the latest findings in safety engineering. To keep it that way, we recommend the use of only genuine Volkswagen spare parts. You can recognise this by the VW Audi logo and by the part number. It has been established that these parts are reliable, safe and suitable.

Despite constant appraisal of the market, we cannot assess other products on these points, even when in isolated cases they have been passed by official inspectors or have been granted official approval. Therefore, we cannot, of course, assume any liability if these products are installed.

> ⚠ **WARNING**
>
> *The products from Volkswagen genuine parts and Votex genuine accessories may differ in fitting requirements, torque specifications and so on.*
>
> *Always follow the respective fitting and operating instructions.*

The wheel and tyre combinations or changes listed in the vehicle tables refer exclusively to Volkswagen Genuine wheels. Approval of wheel and tyre combinations or a change to wheels from the accessories trade is not possible with the certificate statement attached here.

> ⚠ **WARNING**
>
> *The fitting instructions and torque specifications for wheels from Votex genuine accessories may differ from those intended for wheels from Volkswagen genuine parts.*
>
> *Therefore, always observe the torque settings for the wheel bolts as well as the respective fitting and operating instructions.*

56 Passat R36 from model year 2008

General

Volkswagen vehicles are built according to the latest findings in safety engineering. To keep it that way, we recommend the use of only genuine Volkswagen spare parts. You can recognise this by the VW Audi logo and by the part number. It has been established that these parts are reliable, safe and suitable.

Despite constant appraisal of the market, we cannot assess other products on these points, even when in isolated cases they have been passed by official inspectors or have been granted official approval. Therefore, we cannot, of course, assume any liability if these products are installed.

WARNING

The products from Volkswagen genuine parts and Votex genuine accessories may differ in fitting requirements, torque specifications and so on.

Always follow the respective fitting and operating instructions.

The wheel and tyre combinations or changes listed in the vehicle tables refer exclusively to Volkswagen Genuine wheels. Approval of wheel and tyre combinations or a change to wheels from the accessories trade is not possible with the certificate statement attached here.

WARNING

The fitting instructions and torque specifications for wheels from Votex genuine accessories may differ from those intended for wheels from Volkswagen genuine parts.

Therefore, always observe the torque settings for the wheel bolts as well as the respective fitting and operating instructions.

56.1 Passat R36, type 3C model year 2008 to model year 2009

58 Sharan BlueMotion from model year 2009

General

Volkswagen vehicles are built according to the latest findings in safety engineering. To keep it that way, we recommend the use of only genuine Volkswagen spare parts. You can recognise this by the VW Audi logo and by the part number. It has been established that these parts are reliable, safe and suitable.

Despite constant appraisal of the market, we cannot assess other products on these points, even when in isolated cases they have been passed by official inspectors or have been granted official approval. Therefore, we cannot, of course, assume any liability if these products are installed.

> ⚠ WARNING
>
> *The products from Volkswagen genuine parts and Votex genuine accessories may differ in fitting requirements, torque specifications and so on.*
>
> *Always follow the respective fitting and operating instructions.*

The wheel and tyre combinations or changes listed in the vehicle tables refer exclusively to Volkswagen Genuine wheels. Approval of wheel and tyre combinations or a change to wheels from the accessories trade is not possible with the parts certificate attached here.

> ⚠ WARNING
>
> *The fitting instructions and torque specifications for wheels from Votex genuine accessories may differ from those intended for wheels from Volkswagen genuine parts.*
>
> *Therefore, always observe the torque settings for the wheel bolts as well as the respective fitting and operating instructions.*

The wheel and tyre combinations or changes listed in the vehicle tables refer exclusively to Volkswagen Genuine wheels. Approval of wheel and tyre combinations or a change to wheels from the accessories trade is not possible with the parts certificate attached here.

> ⚠ **WARNING**
>
> *The fitting instructions and torque specifications for wheels from Votex genuine accessories may differ from those intended for wheels from Volkswagen genuine parts.*
>
> *Therefore, always observe the torque settings for the wheel bolts as well as the respective fitting and operating instructions.*

60 Touareg R50 from model year 2008

General

Volkswagen vehicles are built according to the latest findings in safety engineering. To keep it that way, we recommend the use of only genuine Volkswagen spare parts. You can recognise this by the VW Audi logo and by the part number. It has been established that these parts are reliable, safe and suitable.

Despite constant appraisal of the market, we cannot assess other products on these points, even when in isolated cases they have been passed by official inspectors or have been granted official approval. Therefore, we cannot, of course, assume any liability if these products are installed.

> ⚠ **WARNING**
>
> *The products from Volkswagen genuine parts and Votex genuine accessories may differ in fitting requirements, torque specifications and so on.*
>
> *Always follow the respective fitting and operating instructions.*

The wheel and tyre combinations or changes listed in the vehicle tables refer exclusively to Volkswagen Genuine wheels. Approval of wheel and tyre combinations or a change to wheels from the accessories trade is not possible with the parts certificate attached here.

> ⚠ **WARNING**
>
> *The fitting instructions and torque specifications for wheels from Votex genuine accessories may differ from those intended for wheels from Volkswagen genuine parts.*
>
> *Therefore, always observe the torque settings for the wheel bolts as well as the respective fitting and operating instructions.*

63 Recommended summer tyres

Notes regarding the recommended makes of summer tyre

- Tyres are one of the most important elements in motor vehicle construction and have a major influence on road safety. Therefore, they must fulfil numerous conditions which are specified for tyre manufacturers in the DIN (German industrial standards) and the directives of the German rubber industry e. V. (W.d.K.). In addition, comprehensive testing is carried out at Volkswagen before tyres are approved for initial fitting on our vehicles.
- The following lists all tyre makes and tread patterns that are fitted to VW vehicles ex-factory, correct at the time of publication.
- These tyre makes/tread patterns meet the aforementioned demands. We therefore recommend the tyres/tread types listed in this guide are chosen as replacements.
- Observe special requirements for tyres with run-flat properties ⇒ page 55 .

64 Recommended all-season tyres

Notes regarding the recommended makes of all-season tyre

- Tyres are one of the most important elements in motor vehicle construction and have a major influence on road safety. Therefore, they must fulfil numerous conditions which are specified for tyre manufacturers in the DIN (German industrial standards) and the directives of the German rubber industry e. V. (W.d.K.). In addition, comprehensive testing is carried out at Volkswagen before tyres are approved for initial fitting on our vehicles.
- The following lists all tyre makes and tread patterns that are fitted to VW vehicles ex-factory, correct at the time of publication.
- These tyre makes/tread patterns meet the aforementioned demands. We therefore recommend the tyres/tread types listed in this guide are chosen as replacements.
- Observe special requirements for tyres with run-flat properties ⇒ page 55

65 Recommended winter tyres

Notes regarding the recommended makes of winter tyre

- Tyres are one of the most important elements in motor vehicle construction and have a major influence on road safety. Therefore, they must fulfil numerous conditions which are specified for tyre manufacturers in the DIN (German industrial standards) and the directives of the German rubber industry e. V. (W.d.K.). In addition, comprehensive testing is carried out at Volkswagen before tyres are approved for initial fitting on our vehicles.
- The following lists all tyre makes and tread patterns that are fitted to VW vehicles ex-factory, correct at the time of publication.
- These tyre makes/tread patterns meet the aforementioned demands. We therefore recommend the tyres/tread types listed in this guide are chosen as replacements.
- Observe special requirements for tyres with run-flat properties ⇒ page 55 .
